## **Chapter 1 - Introduction**

This chapter is an introduction to the Reduced Voltage Solid State Soft Starter for medium voltage AC motors. It is highly recommended that users read this section thoroughly to become familiar with the basic configuration, operation and features before applying the Soft Starter.

#### 1.1 Overview

The standard Soft Starter is an SCR-based controller designed for the starting, protection and control of AC medium voltage motors. It contains SCR stack assemblies, fiber optic connections, and low voltage control circuitry ready to be interfaced with an enclosure and the necessary equipment to create a complete a Class E2 medium voltage motor Soft Starter.

## 1.2 Specifications

| GENERAL   |   |  |  |
|---|---|--|--|
| AC Supply Voltage                                     | 1000 – 7200VAC +10 to – 15% (Model dependent)   |  |  |
| Unit Running Overload Capacity (Percent of motor FLA) | <ul><li>125% - Continuous</li><li>500% - 60 seconds, 600% - 30 seconds.</li><li>1 Cycle: Up to 14x FLA (Internally protected by the programmable short circuit)</li></ul>   |  |  |
| Frequency   | 50 or 60Hz, +2Hz hardware selectable  |  |  |
| Power Circuit   | 6 SCRs, 12 SCRs, 18 SCRs (Model dependent)  |  |  |
| SCR Peak Inverse Voltage Ratings                      | 4500V - 19500V (Model dependent see Table 1) Note: Contact Factory  |  |  |
| Phase Insensitivity                                   | User selectable phase sequence detection  |  |  |
| Transient Voltage Protection                          | RC snubber dv/dt networks (One per inverse pair of SCRs)  |  |  |
| Ambient Condition Design                              | Enclosed units: 0° to 40°C (32° to 104°F) (optional - 20° to 50° C with heaters) 5 - 95% relative humidity 0 - 3300 ft. (1000m) above sea level without de-rating (Ratings for ambient conditions external to unit) |  |  |
| Control   | 2 or 3 wire 120VAC (Customer supplied)  |  |  |
| Auxiliary Contacts                                    | Multiple: Form C (Contacts), rated 5 Amps, 240VAC max.  8 Relays (4 programmable): Form C contacts  Fault Indicator: Form C contacts  |  |  |
| BIL Rating  | 1000V – 30KV , 2300V - 7200V 60KV   |  |  |
| Approvals   | UL recognized, Canadian UL (cUL) recognized   |  |  |

| ADVANCED MOTOR PROTECTION                      |   |  |  |
|--|---|--|--|
| Two Stage Electronic<br>Overload Curves        | Starting: Programmable for Class 5 through 30 Run: Programmable for Class 5 through 30 when "At-Speed" is detected.   |  |  |
| Overload Reset                                 | Manual  |  |  |
| Retentive Thermal Memory                       | Overload circuit retains thermal condition of the motor regardless of control power status. Unit uses real time clock to adjust for off time.   |  |  |
| Dynamic Reset Capacity                         | Overload will not reset until thermal capacity available in the motor is sufficient for a successful restart. Starter learns and retains this information by monitoring previous successful starts. |  |  |
| Phase Current Imbalance Protection             | Imbalance Trip Level: 5 - 30% current between any two phases Imbalance Trip Delay: 1 -20 seconds  |  |  |
| Over Current Protection (Electronic Shear Pin) | Trip Level: 100 - 300% of motor FLA Trip Delay: 1 - 20 seconds  |  |  |
| Load Loss Trip Protection                      | Under Current Trip Level: 10 -90 % of motor FLA Under Current Trip Delay: 1 - 60 seconds  |  |  |
| Coast Down (Back Spin) Lockout Timer           | Coast Down Time Range: 1 - 60 minutes   |  |  |
| Starts-per-hour Lockout Timer                  | Range: 1 - 6 successful starts per hour Time between starts: 1 - 60 minutes between start attempts  |  |  |

| PROGRAMMABLE OUTPUTS     |  |  |  |
|--------------------------|--|--|--|
| Type / Rating            | Form C (SPDT), Rated 5 amps 240 VAC max, (1200 VA)   |  |  |
| Run Indication           | Programmable   |  |  |
| At Speed Indication      | Programmable   |  |  |
| Acceleration Adjustments | Programmable Ramp Types: Voltage or Current Ramp (VR or CR) Starting Torque: 0 - 100% of line voltage (VR) or 0 - 600% of motor FLA (CR) Ramp Time: 1 to 120 seconds Current Limit: 200 - 500% (VR or CR) Power Ramp: 0 - 300% |  |  |
| Dual Ramp Settings       | 4 Options: VR1+VR2; VR1+CR2; CR1+CR2; CR1+VR2  Dual Ramp Control: Ramp 1 = Default  Ramp 2 = selectable via dry contact input  |  |  |
| Deceleration Adjustments | Begin Decel Level: 80 - 100% of line voltage Stop Level: 0 to 1% less than Begin Decel Level Decel Time: 1 - 60 seconds  |  |  |
| Jog Settings             | Voltage Jog: 5 - 75%   |  |  |
| Kick Start Settings      | Kick Voltage: 10 - 100%<br>Kick Time: 0.1 - 2 seconds  |  |  |
| Fault Display            | Shorted SCR, Phase Loss, Shunt Trip, Phase Imbalance Trip, Overload, Overtemp, Overcurrent, Short Circuit, Load Loss, Undervoltage or Any Trip   |  |  |
| Lockout Display          | Coast Down Time, Starts Per Hour, Time Between Starts, and Any Lockout   |  |  |

| EVENT HISTORY   |  |  |
|-----------------|--|--|
| Up to 60 Events | Data includes cause of event, time, date, voltage, power factor and current for each phase and ground fault current at time of event |  |

| METERING FUNCTIONS  |   |  |
|---|---|--|
| Motor Load  | Percent of FLA  |  |
| Current Data  | A, B, C Phase Current, Avg Current, Ground Fault (Option) |  |
| Thermal Data  | Remaining thermal register; thermal capacity to start     |  |
| Start Data  Avg Start Time, Avg Start Current, Measured Capacity to start, time since last start. |   |  |
| RTD Data (Option)   | Temperature readings from up to 12 RTDs (6 stator RTDs)   |  |
| Voltage Metering  | kW, kVAR, PF, kWH   |  |

| SERIAL COMMUNICATIONS |  |  |
|-----------------------|--|--|
| Protocol              | Modbus RTU   |  |
| Signal                | RS-485, RS-422 or RS232  |  |
| Network               | Up to 247 devices per mode   |  |
| Functionality         | Full operation, status view, and programming via communications port |  |

| OPERATOR INTERFACE      |  |  |  |
|-------------------------|--|--|--|
| LCD Readout             | Alpha numeric LCD display  |  |  |
| Keypad                  | 8 function keys with tactile feedback  |  |  |
| Status Indicators       | 12 LEDs include Power, Run, Alarm, Trip, Aux Relays                              |  |  |
| Remote Mount Capability | Up to 1000 circuit-feet from chassis (Use twisted, shielded wire & power source) |  |  |

| CLOCK and MEMORY             |   |  |
|------------------------------|---|--|
| <b>Operating Memory</b>      | SRAM loaded from F-RAM at initialization        |  |
| Factory Default Storage      | Flash Memory                                    |  |
| Customer Settings and Status | Non-volatile F-RAM, no battery backup necessary |  |
| Real Time Clock              | Lithium ion battery for clock memory only       |  |

#### 1.4 Design Features

The standard Soft Start panel has the following features:

- **SCR Power Modules:** For each phase, the SCRs are arranged in inverse parallel pairs and series *strings* as indicated in Table1 below to facilitate sufficient Peak Inverse Voltage ratings for the application
- RC Snubber Networks: Provide Transient Voltage Protection for SCR Power Modules in each phase to avoid dv/dt damage.
- **Firing Circuit:** The SCRs are gated (turned on) using a Sustained Pulse Firing Circuit. This circuitry is isolated from the control voltage by means of fiber optics.

Table 1 Unit PIV Ratings

### 1.5 Theory of Operation

The Soft Starter is CPU controlled, using a microprocessor based protection and control system for the motor and starter assembly. The CPU uses Phase Angle Firing control of the SCRs to apply a reduced voltage to the motor, and then slowly and gently increases torque using voltage and current control until the motor accelerates to full speed. This starting method lowers the starting current of the motor, reducing electrical stresses on the power system and motor. It also reduces peak starting torque stresses on both the motor and mechanical load, promoting longer service life and less downtime.

#### 1.5.1 Acceleration:

The soft starter comes standard with several methods of accelerating the motor so that it can be programmed to match almost any industrial AC motor application. The factory default setting applies a **Voltage Ramp** with **Current Limit** as this has been proven to be the most reliable starting method for the vast majority of applications. Using this starting method, the Initial Voltage setting applies just enough voltage to cause the motor shaft to begin to turn. This voltage is then gradually increased over the "Ramp Time" setting, until one of two things happen: the motor accelerates to full speed, or the Ramp Time expires and the Current Limit setting is reached.

If the motor accelerates to full speed before the ramp time has expired, an automatic Anti-Oscillation feature will override the remaining ramp time and full voltage will be applied. This will prevent any surging or pulsation in the motor torque, which might otherwise occur If the motor has not reached full speed at the end of the ramp time setting, the current limit setting will proportionally regulate the maximum output torque. CPU algorithms provide protection against a stall condition, an overload condition or excessive acceleration time.

The Current Limit feature is provided to accommodate installations where there is limited power available (For example, on-site generator power or utility lines with limited capacity). The torque is increased until the motor current reaches the pre-set Current Limit value at which point it is then held. Current Limit overrides the ramp time setting so if the motor has not accelerated to full speed under the Current Limit setting, the current remains limited for as long as it takes the motor to accelerate to full speed.

When the motor reaches full speed and the current drops to running levels, the soft starter detects an At-Speed condition and automatically closes the Bypass Contactor. The Bypass Contactor serves to shunt power around the SCR stack assemblies to prevent heat build-up in the starter enclosure. At this point, the motor is operating at full voltage, speed and power.

Other starting methods available in the soft starter are:

- Current Ramp: Uses a closed loop current feedback algorithm to provide a linear current increase up to a Maximum Current level.
- Constant Current: current is immediately increased to the Current Limit point and held there until the motor reaches full speed.
- Power (KW) Ramp: Uses a True RMS KW feedback PID loop to provide a linear increase in True RMS motor power to a maximum set KW value.
- **Custom Curve:** Gives the user the ability to plot torque and time points on a graph. The soft starter will then accelerate the motor following these points.
- **Tachometer Feedback Ramp:** uses a closed loop speed follower method monitoring a tachometer input signal from the motor or load shaft to provide a linear RPM acceleration.

**1.5.2 Deceleration:** The soft starter provides the user with the option of having the load coast to a stop or controlling the deceleration by slowly reducing the voltage to the motor upon initiating a stop command. The Decel feature is the **opposite of DC injection braking** in that the motor will actually take longer to come to a stop than if allowed to coast to a stop. The most common application for the Decel feature is pumping applications where a controlled stop prevents water hammer and mechanical damage to the system.

#### 1.6 General Protection

The Soft Starter is provided with a built-in motor protection relay that can be programmed for primary protection of the motor / load system. Operation of the Soft Starter can be divided into 4 modes; Ready, Start, Run and Stop.

1.6.1. Ready Mode: In this mode, control and line power are applied and the Starter is ready for a start command.

Protection during this mode includes the monitoring of current for leakage through multiple shorted SCRs or welded contacts on the Bypass Contactor. Other protection features in effect are:

- Starter Power Pole Temperature
- Shorted SCR
- Blown Fuse Indication
- Phase Reversal (if enabled)
- Line Frequency Trip Window
- External Input Faults (Digital Input Faults are active in all modes)
- Undervoltage
- Overvoltage

**Note:** The "Programming Mode" can only be entered from the Ready Mode. Any attempt to enter data while the motor is starting or running will be blocked. During programming, all protection features and start command are disabled.

1.6.2 Start Mode: These additional protection functions are enabled when the Soft Starter receives a valid Start command:

- Phase Reversal (if enabled) Phase Reversal will still be on and is not a newly activated feature when starting.
- Start Curve
- Acceleration Timer
- Phase Imbalance
- Short Circuit / Load Pre-check (Toe-in-the-Water)
- Ground Fault (Optional)
- External Input Faults
- Accumulated Starting FLA Units (I2t Protection)
- Starting Overload Protection Curve Selection
- Thermal Capacity

Note: Shorted SCR protection is no longer in effect once the soft starter goes into the Start Mode.

**1.6.3 Run Mode**: The soft starter enters the Run Mode when it reaches full output voltage *and* the motor current drops below the FLA setting (motor nameplate FLA plus service factor) for a pre-determined period of time. During the Run Mode these additional protection features are enabled:

- Running Overload Protection Curve Selection
- Phase Loss
- Under Current / Load Loss
- Over Current / Electronic Shear Pin (Jam Protection)
- External Input Faults

1.6.4 Stop Mode: Once a Stop command has been given, the protection features change depending on which Stop Mode is selected.

- Decel Mode: Retains all protection features of the Run Mode. At the end of Decel, the motor will be stopped and the
  protection features change as indicated below.
- Coast-To-Stop Mode: Power is immediately removed from the motor and the Soft Starter returns to the Ready Mode.
- Additional protection features activated when the stop command is given include:
  - Coast-Down / Back Spin Timer
  - o Starts-per-Hour
  - o Time between Starts
  - External Input Faults

#### 1.7 Thermal Overload Protection

The Soft Starter plays an important role in the protection of your motor in that it monitors the motor for excessive thermal conditions due to starting, running and ambient conditions. The soft starter has a Dynamic Thermal Register system in the CPU that provides a mathematical representation of the thermal condition of the motor.

This thermal information is retained in memory and is monitored for excesses in both value and rate of change. Inputs are derived from current values, imbalances and (optional) RTD measurements making it dynamic to all processes involving the motor. The Soft Starter monitors these conditions separately during the Start and Run modes to provide proper thermal protection at all times.

- 1.7.1 Start Mode overload protection is selectable using one of three methods:
- Basic Protection: I2t data is accumulated and plotted based on an Overload Curve selected in programming. This is programmed per NEMA Class 5-30 standard curves and is based on the Locked Rotor Current (from the motor nameplate) as programmed into the Soft Starter.
- **Measured Start Capacity:** The user enters a measured amount of thermal capacity from a pre-selected successful start as a set point to the Thermal Register for the soft starter to follow.
- Learned Curve Protection: The user sets the soft starter to the "LEARN" mode and starts the motor under normal starting conditions. The CPU then samples and records 100 data points during the start curve, analyzes them and creates a graphical representation in memory. The soft starter is then switched to Curve Follow protection mode and monitors motor performance against this curve. This feature is especially useful in initial commissioning tests to record a base line performance sample (In this case, it is not necessarily used for motor protection).

1.7.2 Run Mode overload protection is initiated when the soft starter determines that the motor is At-Speed. Overload Protection is initiated when the motor RMS current rises above a "pick-up point" (as determined by the motor nameplate FLA and service factor). Run mode protection is provided by the CPU monitoring the Dynamic Thermal Register. Data for the Dynamic Thermal Register is accumulated from I2t calculations and cooling rates. A trip occurs when the register reaches 100% as determined by the selected Overload Protection Curve (NEMA Class 5-30 standard curves) and is based on the programmed Locked Rotor Current indicated on the motor nameplate. The Dynamic Thermal Register is altered, or "biased", by the following conditions:

- Current Imbalance will bias the register higher due to additional motor heating as a result of a line current imbalance condition.
- **Normal Cooling** is provided when the motor current drops below the overload pick-up point or the motor is off line. The Cooling rate is lower for motors that are off-line (such as after a trip) since cooling fans are also inoperative.
- RTD Input (Requires the optional RTD monitor card) provides a separate means of motor protection based on actual temperatures measurements inside the motor. It runs independently of the Thermal Register Model and does not provide input to, or bias that model.
- **Dynamic Reset** is another feature that adds reliability and consistency to the performance of the soft starter. If a motor overload condition occurs and the Overload protection trips, it cannot be reset until sufficient cool down time has elapsed. This cool down time is determined by the "Learned Thermal Capacity" required to start the motor which must be regained before the overload can be reset. This ensures sufficient thermal capacity for a successful restart of the motor.
- Retentive Memory provides continuous overload protection and true thermal modeling by means of a running back up of the thermal register even if power is lost. Upon restoration of power, the soft starter will read the Real Time Clock, then recalculate and restore the thermal register to what it should be, given the elapsed time and the cool down rate of the motor.
- Learned Reset Capacity is a feature that is unique to the Soft Starter. By sampling the amount of thermal capacity used in the previous three successful starts, the starter will not allow a reset until a sufficient amount of thermal capacity has been regained in the motor. This prevents nuisance tripping and insures that unsuccessful start attempts (which would otherwise use up the starts-per-hour capacity of the motor) are not counted.

#### 1.8 Firing Circuit

The SCR gate firing circuit is critical to the performance and stability of the system. The firing circuit includes several unique features which enhance the ruggedness, noise immunity and flexibility for maximized performance. These features include:

- Auto Synchronizing of the gate timing pulses match each phase firing angle to their respective phases. The Soft
  Starter actively tracks minor shifts in the line frequency avoiding nuisance tripping that may happen with conventional
  gate firing systems. This is especially useful on portable or backup generator supplies, allowing the soft starter to be
  used confidently in applications that have unstable power.
- **Sustained Pulse** firing keeps the firing signal active for 270 electrical degrees ensuring that the DC gate pulse forces the SCR to fire even if line noise is present. This provides the Soft Starter with superior noise immunity and protects against misfiring, enhancing the soft starter system stability.
- Closed Loop Firing Control is a method of balancing the SCR firing pattern. The CPU uses feedback signals from the output current and voltage providing to provide smooth output preventing imbalances during ramping which prevents unnecessary motor heating.
- Transformer Isolation of SCR firing information and signals prevents interference from line noise and EMI/RFI that
  may be present. Three phase isolation transformers provide potential measurement, firing board timing while
  providing isolation from the line voltage. High isolation Ring Transformers are used to step the 120v control voltage
  down to 28VAC for the Sustained Pulse firing circuit, providing further isolation for the SCR gates.
- **Fiber Optic Isolation** is provided for all gate drive and current feedback signal interfaces between the Medium and Low Voltage systems.

#### 1.9 Electronics

The Soft Starter electronic systems are divided into two categories; Low Voltage and Medium Voltage and are based on where they are located in the Starter structure.

- **1.9.1 Low Voltage** electronics include the Keypad Operator Interface, the CPU and Main Power PC boards which are located in an isolated Low Voltage compartment of the enclosure.
- **Keypad Operator Interface** is a 2 line x 20 character LCD display with back-lighting for low ambient light conditions. The display reads out in truncated English and can show multiple data points in each screen. Twelve LED indicators are included which show the status of, Power, RUN, ALARM, TRIP and the 8 AUX RELAYS. The Operator communicates with the CPU board via a serial cable link and can be remotely located up to 1000ft. from the starter. **FIG. 1.9** shows the Keypad Operator Interface.

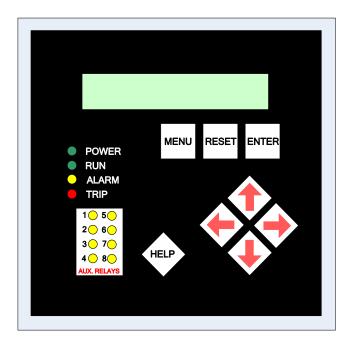

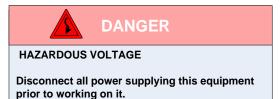

FIG. 1.9 Keypad Operator Interface.

- CPU Board is where the microprocessor and communications co-processor are located. It is attached to the main Power board. The CPU determines operating functions, stores user programming, acts upon feedback signals for faults, and calculates metering and historical data. The board communicates with the Keypad Operator Interface via a serial link cable. Analog and Digital I/O are also located on the CPU board. (See FIG. 2.3.4)
- Main Board also referred to as the Firing Board, contains the Auxiliary I/O relays and interfaces to the TCB board (see below) for user interface. This board generates all firing signals for the SCR stacks and receives feedback signals which are isolated via fiber optics. The board also provides signal conditioning in preparation for analog to digital conversion. (See FIG. 2.3.3)

**1.9.2 Control Electronics** are located in the Medium Voltage section of the soft starter. They include the Gate Drive and Temp / CT boards.

Failure to follow this instruction will result in death or serious injury.

- TCB (Terminal and Control Board) is the user connection interface board. This board contains the user terminal blocks, output relays (duplicated), inputs and control power connections. It also contains additional timed relays for interfacing with Power Factor Correction contactors (if used) and other external devices. Please note Power Factor Capacitor warnings in Section 2.1.; also see FIG. 2.2.1.
- **Gate Drive Boards** are located directly on the SCR stacks. These boards connect to the Main Power board via fiber optic cables. They amplify the gate pulse signals with power from the Ring Transformers to create the Sustained Pulse Firing of the SCRs. There is one Gate Drive board for each pair of SCRs in each stack.
- **Temp / CT Boards** are attached to the Gate Drive boards on the SCR stacks and provide the heat sink Temperature and line current signals back to the Main Power Board via fiber optic cables.
- MOV Boards are attached to standoffs mounted on the SCR heat sinks and are mounted directly below the Gate
  Drive boards. The MOV boards are used to protect the SCRs from over voltage.
- **DV/DT Boards** are also attached to standoffs mounted on the SCR heat sinks and are mounted below the MOV boards. The DV/DT boards are used to mitigate voltage transients across the stack assemblies.

## **Chapter 2 – Connection**

#### 2.1 Warnings

- Do not service this equipment with voltage applied! The unit can
  be the source of fatal electric shock! To avoid shock hazard,
  disconnect main power and control power before working on the unit.
  Warning labels must be attached to terminals, enclosure and control
  panel to meet local codes observing Lock Out, Tag Out procedures.
- Do not connect (PFC) capacitors or surge capacitors to the load side (motor side) of the unit. This will cause di/dt damage to the SCRs when they are turned on and will void the warranty on this product. Capacitors can only be connected to the load side of the starter through the use of an isolating contactor which is closed after the soft starting sequence has been completed or when di/dt limiting inductors are factory installed.
- Avoid connecting capacitors to the input side of the unit. If you
  cannot avoid using capacitors across the power lines, they must be
  located as far upstream as possible of the input line contactor. In this
  situation, an optional power factor correction (PFC) capacitor contactor
  should be specified. For additional information and specifications or
  when di/dt limiting inductors are factory installed, please contact the
  factory.
- Never interchange the input and output power connections on the unit. This will cause excessive voltage to the control circuit logic.
- For bus protection, it is strongly recommended to use non-gap
   MOV Type lightning arrestors in areas where lightning is a significant problem. The arrestors should be mounted on the nearest utility pole at the Station or optionally included with the unit at the time of order.
- Medium Voltage cables can have significant capacitance values by design which can elevate Di/Dt thru the SCRs to unsafe levels. Compensating inductors can limit these values to safe levels. Contact the factory if you need more information on this subject.

#### **DANGER**

#### **HAZARDOUS VOLTAGE**

Disconnect all power supplying this equipment prior to working on it.

Failure to follow this instruction will result in death or serious injury.

#### **CAUTION**

#### **SCR DAMAGE**

Do not connect (PFC) capacitors to the load side of the unit.

Doing so will cause DI/DT damage to the SCRs when energized.

#### WARNING

#### SAFETY HAZARD

Do not bypass electrical or mechanical interlocks.

Failure to follow this instruction will cause severe equipment damage, serious injury or death.

#### 2.2 Control Connections - TCB (Terminal and Control Board)

#### 2.2.1 TCB Board

The TCB board, FIG. 2.2.1 shown below, provides interconnections between the main power and CPU boards and the customer's control logic connections. It is a 120 VAC control board with several auxiliary dry contacts, built-in time delay circuits and an emergency bypass function. It also controls the inline isolation and bypass contactor and provides provisions for shutdown interlocks. (See **Section 2.2.2** for terminal designations and descriptions)

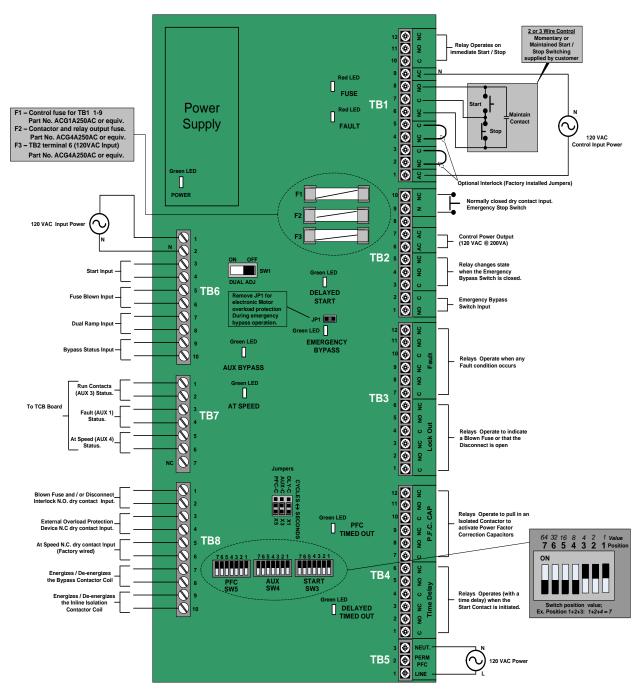

FIG. 2.2.1 TCB Terminal and Control Board

## 2.2.2 Description of Terminal Connections

|                | TB1 Start / Stop Control   |  |  |  |

## 2.2.3 Description of Jumper Selections and Functions

| Jumper Selection |    |                    |   |  |
|------------------|----|--------------------|---|--|
| Jumper           |    | Time Delay         | Function  |  |
| DLY-C            | X1 | Seconds<br>/Cycles | Start Delay  Jumper selects between seconds or cycles (1/60 <sup>th</sup> of a second) for the start delay when a Start command is received and when the CPU actually receives the start signal.  Default jumper setting is seconds.  |  |
| AUX-C            | хз | Seconds<br>/Cycles | Auxiliary (Start) Delay  Jumper selects between seconds or cycles (1/60 <sup>th</sup> of a second) for the auxiliary start delay when a Start command is received and when the CPU actually receives the start signal. Default jumper setting is seconds.   |  |
| PFC-C            | Х5 | Seconds<br>/Cycles | PFC Contactor Delay  Jumper selects between seconds or cycles (1/60 <sup>th</sup> of a second) for the delay when the Bypass Contactor closes to when the Power Factor Capacitors Contactor is activated. Default jumper setting is seconds.  |  |
| JP1              |    | N/A                | Motor Protection Jumper  When this jumper is in place, the CPU will be disabled during operation in the Emergency Bypass Mode. In this case, insure that there is an external means of overload protection. When the jumper is removed, the CPU will be enabled to provide electronic motor protection when operating in the Emergency Bypass Mode. |  |

|        | DIP Switches                                |   |  |  |  |
|--------|---|---|--|--|--|
| Switch | Function                                    |   |  |  |  |
| SW1    | ON: Sets Dual Adjustment OFF: Disabled      |   |  |  |  |
| SW2    | Not Used                                    |   |  |  |  |
| SW3    | Sets the<br>Start Delay<br>Value            | SW3, SW4 and SW5 are 7 position DIP Switches that use binary coding to set the value of the time delay in Cycles or Seconds as selected via jumpers X1 to X6. (See Jumper Table.) The setting range is 0 to 127 (1+2+4+8+16+32+64). The example shown |  |  |  |
| SW4    | Sets the<br>AUX Start<br>Delay Value        | results in a value of 7 (1+2+4)  64 32 16 8 4 2 1 Value 7 6 5 4 3 2 1 Position  ON  |  |  |  |
| SW5    | Sets the<br>PFC<br>Contactor<br>Delay Value | Switch position value; Ex. Position 1+2+3: 1+2+4 = 7  |  |  |  |

## 2.2.5 Description of LED Indicators Functions

|                           | LED Indicators |        |   |  |  |  |
|---------------------------|----------------|--------|---|--|--|--|
| Function                  | Location       | Color  | Function  |  |  |  |
| Fuse Blown/<br>Disconnect | D4             | Red    | ON: When a Fuse is blown and / or a Disconnect is open.                 |  |  |  |
| Fault                     | D16            | Red    | ON: When any Fault has occurred.  |  |  |  |
| Start                     | D7             | Yellow | ON: When a Start signal has been initiated.                             |  |  |  |
| PFC Timed Out             | D17            | Yellow | ON: When the Power Factor Correction Capacitors Contactor is energized. |  |  |  |
| Delay Timed Out           | D15            | Yellow | ON: When the Auxiliary Start Contacts have been energized.              |  |  |  |
| +24V                      | D28            | Green  | ON: +24V supply is good.  |  |  |  |

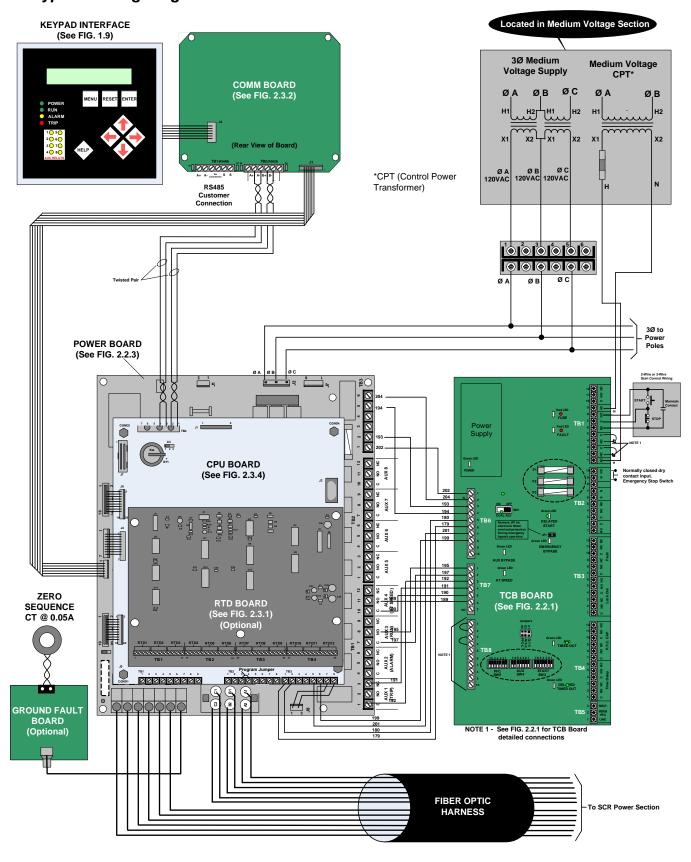

FIG. 2.4 Typical Wiring Diagram

## Chapter 3 - Start-up

#### 3.1 Introduction

It is best to operate the motor at its full load starting condition to achieve the proper settings. Initial settings are set to accommodate most motor conditions. **TRY INITIAL SETTINGS FIRST.** See Section 5.1.2 Starter Configuration (Set Point Page 2) to make any adjustments.

#### 3.2 Acceleration Adjustments

The unit is set at the factory with typical starting characteristics that perform well in most applications. When the system is ready to start, try the initial settings. If the motor does not come up to speed, increase the current limit setting. If the motor does not start to turn as soon as desired, raise the Initial voltage adjustment. Adjustment description and procedures are described as follows. See Section 5.1.2 Starter Configuration (Set Point Page 2) for additional Accel settings.

#### 3.2.1 Initial Voltage

Factory Setting = 20% of line voltage Range = 0% - 100% of line voltage

Initial voltage adjustment changes the initial starting voltage level to the motor.

#### 3.2.2 Ramp Time

Factory Setting = 10 sec. Range = 0 - 120 sec.

Ramp time adjustment changes the amount of time it takes to reach the current limit point or full voltage if the Current limit point was not reached.

**Note:** Refer to your motor manual for the maximum number of starts per hour allowed by the manufacturer and do not exceed the recommended number.

#### 3.2.3 Current Limit (see FIG. 3.2.3)

Factory Setting = 350% of motor FLA Range = 200% - 500% of motor FLA

The main function of current limit is to limit the maximum current. It may also be used to extend the ramp time if required. The interaction between the voltage ramp and the current limit will allow the soft start to ramp the motor until the maximum current is reached and the current limit will hold the current at that level. The current limit must be se high enough to allow the motor to reach full speed. The factory setting of 350% is a good starting point.

Do not set the current limit too low on variable starting loads. This could cause the motor to stall and eventually cause the overload protection to trip.

Note: If the motor does stall, refer to the motor manufacturer's motor data for the proper cooling time.

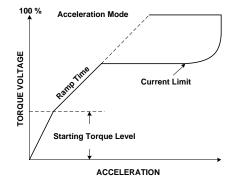

FIG. 3.2.3 Current Limit

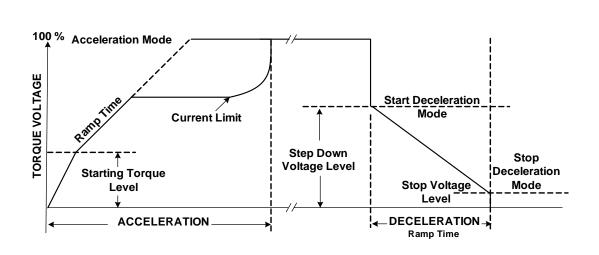

#### 3.3 Deceleration Adjustments (Pump Control)

Decel control extends the stopping time on loads that would otherwise stop too quickly when power is removed. Decel control provides smooth deceleration until the load comes to a stop. Three adjustments optimize the deceleration curve to meet the most demanding requirements. **The unit is shipped from the factory with the Decel control feature disabled.** 

#### 3.3.1 Deceleration Applications

Apply power and adjust the soft start before enabling or modifying the deceleration adjustments. Both, acceleration and deceleration adjustments should be made under normal load conditions. The deceleration feature provides a slow decrease in the output voltage, accomplishing a gentle decrease in motor torque during the stopping mode. This is the *OPPOSITE OF BRAKING* in that, it will take *longer* to come to a stop than if the starter were just turned off. The primary use of this function is to reduce the sudden changes in pressure that are associated with "Water Hammer" and slamming of check valves with centrifugal pumps. Decel control in pump applications is often referred to as **Pump Control**. In a pump system, liquid is being pushed uphill. The force exerted by gravity on the column of liquid as it goes up hill is called the "Head Pressure" in the system. The pump is sized to provide enough Output Pressure to overcome the Head Pressure and move the fluid up the pipe. When the pump is turned off, the Output Pressure rapidly drops to zero and the Head Pressure takes over to send the fluid back down the hill. A "Check Valve" is normally used somewhere in the system to prevent this (if necessary) by only allowing the liquid to flow in one direction. The kinetic energy in that moving fluid is suddenly trapped when the check valve slams closed. Since fluids can't compress, that energy is transformed into a "Shock Wave" that travels through the piping system looking for an outlet in which to dissipate. The sound of that shock wave is referred to as "Water Hammer" and the energy in that shock wave can be extremely damaging to pipes, fittings, flanges, seals and mounting systems.

By using the Soft Stop/Deceleration feature of the soft starter, the pump output torque is gradually and gently reduced, which slowly reduces the pressure in the pipe. When the Output Pressure is just slightly lower than the Head Pressure, the flow slowly reverses and closes the Check Valve. By this time there is very little energy left in the moving fluid and the Shock Wave is avoided. When the output voltage to the motor is low enough to no longer be needed, the soft starter will end the Decel cycle and turn itself off. (See **FIG. 3.3**)

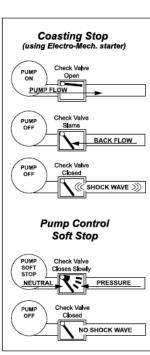

FIG. 3.3 Deceleration Control

Another common application for decel control is on material handling conveyors as a means to prevent sudden stops that may cause products to fall over or to bump into one another. In overhead crane applications, soft stopping of the Bridge or Trolley can prevent loads from beginning to over swing on sudden stops.

#### 3.3.2 Start Deceleration Voltage

Factory Setting = 100% of line voltage Range = 10% - 100% of line voltage

The step down voltage adjustment eliminates the dead band in the deceleration mode that is experienced while the Voltage drops to a level where the motor deceleration is responsive to decreased voltage. This feature allows for an instantaneous drop in voltage when deceleration is initiated.

#### 3.3.3 Stop Deceleration Voltage

Factory Setting = 30% of line voltage Range = 0% - 100% of line voltage

The stop voltage level set point is where the deceleration voltage drops to zero.

#### 3.3.4 Deceleration Time

Factory Setting = 5 sec. Range = 0 - 60 sec.

The deceleration ramp time adjusts the time it takes to reach the stop voltage level set point. The unit should be restarted and stopped to verify that the desired deceleration time has been achieved. When calculating the number of starts per hour, a decel curve should be counted as a start curve. For example, recommended number of starts per hour = 6, allowable starts with decel cycle per hour = 3.

Note: Do not exceed the motor manufacturer's recommended number of starts per hour.

#### 3.4 Sequence of Normal Operation

It is best to operate the motor at its full load starting condition to achieve the proper time, torque and ramp settings. Initial settings are set to accommodate most motor conditions.

TRY INITIAL SETTINGS FIRST FOR: - Initial Voltage

- Current Limit

- Ramp Time

See section 5.1.2 Set-point Page 2 to make any adjustments. If the Decel function is enabled, related parameters may also need adjusting to achieve optimal Decel performance

#### Sequence:

Close the disconnect switch to apply 3 phase power" Verify the power LED on the keypad comes on.

**MOTOR STOPPED READY TO START** 

Activate the start command, the motor should start accelerating and the RUN LED will come ON.

**MOTOR STARTING** 00 x FLA

OVERLOAD ALARM TIME TO TRIP .XXX SECS

**Check:** If the motor decelerates, or stops, during the acceleration period, *activate the Stop button immediately*. Adjustments to the ramp time and or current limit setting are necessary to provide the motor sufficient energy to reach full speed. If the unit does not follow this operational sequence, please refer to the Troubleshooting Chapter.

If the motor does not enter the run mode in the set time (Acceleration time limit, see SP8.2), a trip will occur. When the Motor Reaches full speed the At Speed" LED will come on and the Aux 4 (At speed) relay will energize closing the bypass contactor. Phase A, B, C and Gnd Flt current is then shown on the keypad during operation.

IA:\_\_\_ IB:\_\_\_ IC:\_\_\_ GF:\_\_\_

#### 3.5 Emergency Bypass Operation

#### **Emergency Bypass (1.0 to 7.2kV Class)**

- Remove input power by opening the disconnect switch and lock out.
- Close the emergency Bypass contact located on the TCB board at TB2 (See section 2.2.1 for location).
- Unlock and reclose the disconnect switch.

**Note:** In the emergency bypass mode, there is no overload protection unless a separate (optional or customer supplier) thermal overload relay is installed, or JP-1 (Motor Protection Jumper, Sec.2.2.3) is removed from the TCB Board.

#### **DANGER**

HAZARDOUS OPERATION
Do not operate the Bypass Contactor
with medium voltage power applied
to the unit.

Failure to follow this instruction will cause the motor to start unexpectedly.

The unit is operable as a normal across-the-line starter. When power is applied, the bypass contactor is energized, tying the input terminals directly to the output terminals. When the "START" command is given,-the main (in line) contactor is energized and the motor line starts. When the "STOP" command is given, the motor is disconnected from the line power via the main (in-line) vacuum contactor.

## **Chapter 4 - User Interface & Menu Navigation**

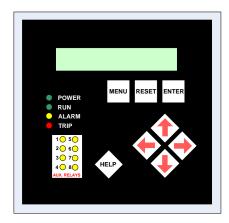

This chapter explains the keypad operator interface, the LCD descriptions and the programming features.

## 4.1 Keypad/Operator Interface

The user keypad/ operator interface consists of:

- 2 row by 20 characters Liquid Crystal Display (LCD)
- 12 LEDs
- 8 pushbuttons

**Note**: The soft starter is menu driven and there are three levels of programming. The programming for two of these levels is password protected. Level two requires a three digit password and level three requires a four digit password.

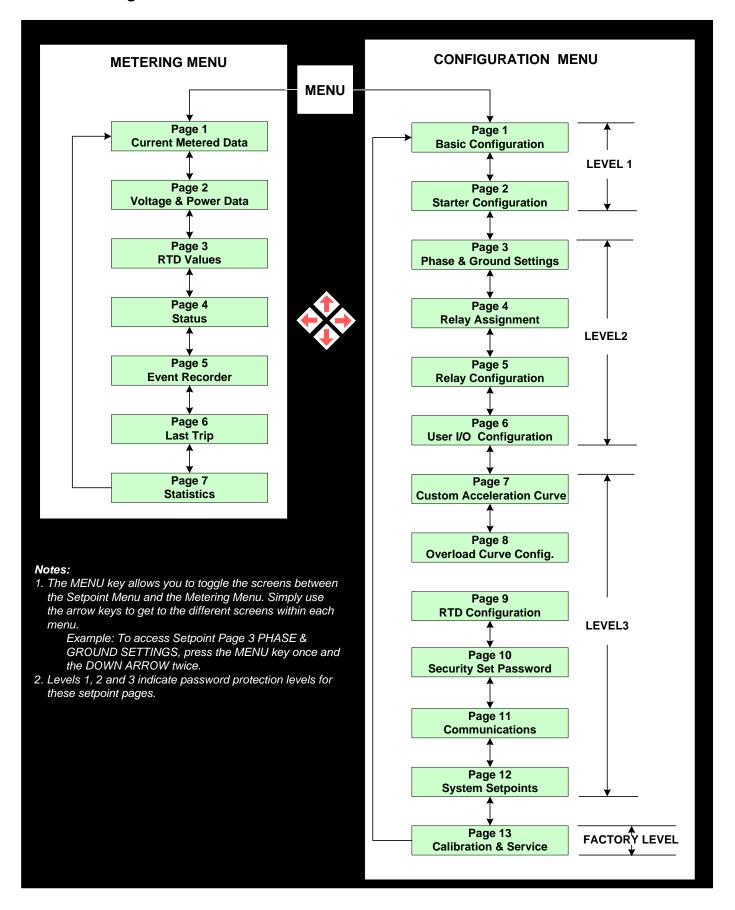

#### 4.1.1. Keypad Operator designations and functions

| ITEM | DESIGNATION | DESCRIPTION   |
|------|-------------|---|
|      | MENU        | Toggle between the menu selection for metering and set point pages.   |
|      | RESET       | Will clear the trip indicator and release the trip relay.   |
|      | ENTER       | Pressing the ENTER button once enters the EDIT mode where set point values can be changed. An "Asterisk" will appear on the display to indicate it is in the edit mode. After a set point value is changed, pressing the ENTER button again will save the revised value to memory and the asterisk will go off indicating the change has been saved. When not in the edit mode, the ENTER pushbutton will toggle through the event indicator list (such as alarms or trips) |
| KEY  | HELP        | Provides general help information about a specific set point or action.   |
|      | UP ARROW    | Will scroll up through the set point and metering menu page. It will scroll to the top of the set point page or a section. In edit mode it will increase a set point in an incremental step or toggle through the available options in the set point.   |
|      | RIGHT ARROW | In the main menu the RIGHT ARROW button provides access to the set point page. For set point pages with multiple columns, the RIGHT ARROW will scroll the set point page to the right. When in edit mode it will shift one character to the right.  |
|      | DOWN ARROW  | Will scroll down through the set point pages and down through the set points. In edit mode, it will decrement through values and toggle available options in the set point.   |
|      | LEFT ARROW  | Will move to the left through set point pages with multiple columns. When in edit mode it will become the backspace key and will shift one character to the left.   |
|      | POWER       | Indicates control power is present  |
|      | RUN         | Indicates unit/motor is running   |
| LED  | ALARM       | Lights in conjunction with Relay AUX 2 to indicate an Alarm event or warn of possible critical condition.   |
|      | TRIP        | Lights in conjunction with Relay AUX 1 to indicate a Trip condition has occurred.   |
|      | AUX 1- 8    | Auxiliary relays (Note: Relays 5-8 are available for customer use)  |

**Note:** The directional arrow buttons require careful operation. In edit mode, if the buttons are held for a long period, the scrolling speed will increase.

#### 4.2 Menu Navigation

#### 4.2.1 Password Access

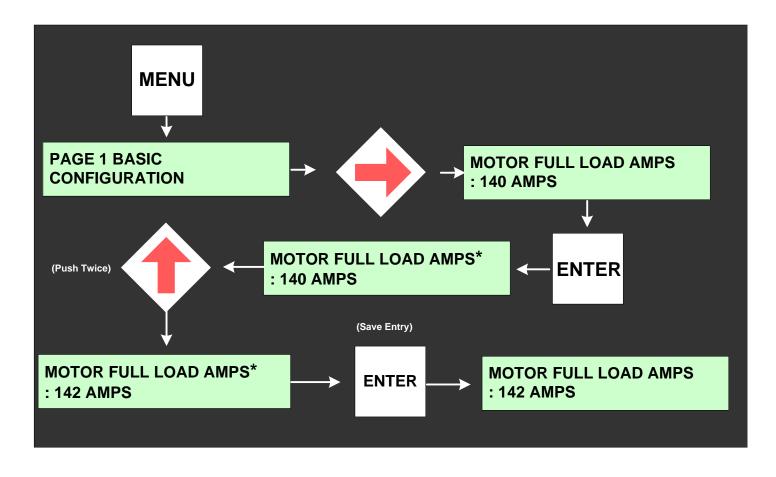

Screens in Level 1 of the set point menu can be changed without password access because they list basic motor information. Screens in Levels 2 and 3 require passwords because they provide more in-depth protection and control of the unit. The password in Levels 2 and 3 can be changed by the user.

Note: Set Points can only be changed when the motor is in Stop/ Ready Mode! The soft starter will not allow a start if it is still in the Edit Mode. When the unit is in the Edit Mode, an asterisk is displayed in the top right corner screen.

#### 4.2.2 Changing Set Points

#### Example 1: Changing Motor FLA from 140 AMPS to 142 AMPS

- 1. Press MENU button to display Set point Page 1, Basic Configuration
- 2. Press the RIGHT ARROW you will view the screen Motor Full Load Amps.
- 3. Press the ENTER button for edit mode. **Note:** The asterisk (\*) in the top right corner of the LCD screen that indicates Edit Mode.
- 4. To change the value, select the UP ARROW or DOWN ARROW. In this case push the UP ARROW twice (2x).
- 5. To accept the new value, press the ENTER button. The unit will accept the changes and will leave the edit mode. Note the \* is no longer in the top right corner of the LCD Display.

## **Chapter 5 - Setpoint Programming**

The soft starter has thirteen programmable Setpoint pages which define the motor data, ramp curves, protection, I/O configuration and communications. In Section 5.1, the Setpoint pages are outlined in chart form. In Section 5.2 the Setpoint pages are illustrated and defined for easy navigation and programming. *Note:* Setpoints can only be changed then the starter is in the Ready Mode. Also the soft start will not start when it is in programming mode.

## 5.1 Setpoints Page List

These charts list the Setpoint Page, the programmable functions and the section.

#### 5.1.1 Basic Configuration (Setpoint Page1)

| Setpoint<br>Page  | Security<br>Level | Description                    | Factory Setting Default | Range                                | Section |
|-------------------|-------------------|--------------------------------|-------------------------|--------------------------------------|---------|
| _                 | eq                | Motor Full Load Amps (FLA)     | Model dependent         | 50 - 100% of Unit Max Current Rating | SP1.1   |

### 5.2 Setpoints Menu and Parameter Explanation (SP1 – SP13)

### SP.1 Basic Configuration (Setpoint Page 1)

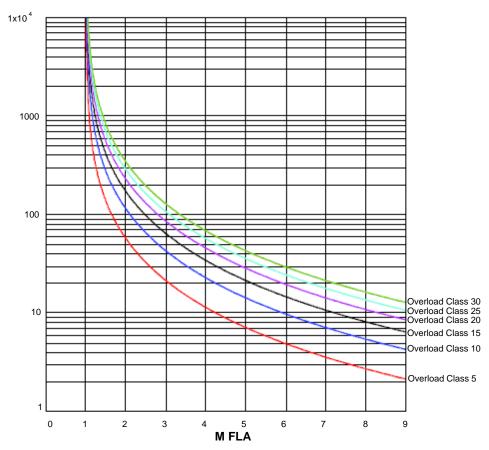

In Setpoint Page 1, is used to setup basic nameplate data of the motor.

**SP1.1 Motor Full Load Amps (FLA):** Allows the user to enter the motor's FLA rating. Range of adjustment is 50 - 100% (less programmed service factor).

**SP1.2 Service Factor**: Sets the pickup point on the overload curve as defined by the programmed motor full load current. Ex: If the motor FLA is 100 and the service factor is 1.15, the overload pickup point will be 115 Amps.

**SP1.3 Overload Class:** Choose the motor protection overload class, range from 5-30. Ex: Overload Class 10 will trip in 10 seconds at six times Motor FLA.

SP1.4 NEMA design: The motor design maximum allowed slip (Select from Class A through F).

SP1.5 Insulation Class: The motor insulation temperature class (Select A, B, C, E, F, G, H, K, N or S).

SP1.6 Line Voltage Input: Applied Voltage.

**SP1.7 Line Frequency:** The user may choose either 50 Hz or 60 Hz.

### SP.2 Starter Configuration (Setpoint Page 2)

#### SP2 Starter Configuration (Setpoint Page 2) Menu Navigation

SP2.1 Start Control Mode: Dual Ramp, Custom Accel Curve, Jog Voltage, Start Ramp 1, Start Ramp 2.

- **Dual Ramp:** The dual ramp mode works in conjunction with External Input #3. This allows the user to switch between the two start ramps without having to reconfigure the start mode. (For details on configuring External Input #3 for DUAL RAMP see Setpoint **Page 6**.)
- Custom Accel Curve: Allows the user to custom design the acceleration start curve to the application. (See Setpoint page 7 for configuration setup.)

**Note:** If Custom Accel Curve has not been enabled in Setpoint page 7, the soft starter will ignore the start control mode and read this Setpoint as disabled.

SP2.2 Jog Voltage: The voltage level necessary to cause the motor to slowly rotate.

**SP2.3 Start Ramp 1 Type:** The ramp type can be setup for either Voltage or Current. If Voltage is selected, initial voltage, ramp time and current limit are adjustable. If Current is selected, initial current, ramp time and maximum current are adjustable.

### Start Ramp 1 Type: Voltage

• Voltage Ramping is the most reliable starting method, because the starter will eventually reach an output voltage high enough to draw full current and develop full torque. This method is useful for applications where the load conditions change frequently and where different levels of torque are required. Typical applications include material handling conveyors, positive displacement pumps and drum mixers. Voltage is increased from a starting point, (Initial Torque) to full voltage over an adjustable period of time (Ramp Time). To achieve Voltage Ramping, select VOLTAGE for the START RAMP #1 TYPE Setpoint and set CURRENT LIMIT #1 Setpoint to 500% (The maximum setting). Since this is essentially Locked Rotor Current on most motors, there is little or no Current Limit effect on the Ramp profile.

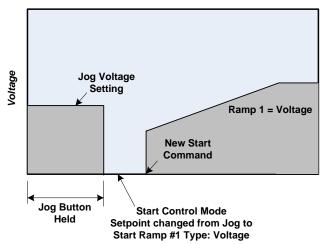

FIG. SP2.3 Example of Switching from Jog to Start Ramp #1 Type: Voltage

• Voltage Ramping with Current Limit is the most used curve and is similar to voltage ramping however, it adds an adjustable maximum current output. Voltage is increased gradually until the setting of the Maximum Current Limit Setpoint is reached. The output is held at this level until the motor accelerates to full speed. This may be necessary in applications where the electrical power is limited. Typical applications include portable or emergency generator supplies, utility power near the end of a transmission line and utility starting power demand restrictions.

**Note:** Using Current Limit will override the Ramp Time setting if necessary, so use this feature when acceleration time is not critical.

To set Voltage Ramping with Current Limit, select VOLTAGE for the START RAMP #1 Setpoint and set CURRENT LIMIT #1 Setpoint to a desired lower setting, as determined by your application requirements.

#### Start Ramp 1 Type: Current

### • Current Ramping (Closed Loop Torque Ramping)

This method is used for smooth linear increase of output torque. This ramp is only used on some conveyor systems (long haul or down hill). For other applications, use Voltage Ramp or a custom Accel curve. Output voltage is constantly updated to provide the linear current ramp, and therefore the available torque is maximized at any given speed. This is for applications where rapid changes in torque may result in load damage or equipment changes. Typical applications include overland conveyors if belt stretching occurs; fans and mixers if blade warping is a problem; and material handling systems if stacked products fall over or break.

This feature can be used with or without the Maximum Current Limit setting. To achieve Current Ramping select CURRENT for START RAMP #1 TYPE Setpoint and set the MAXIMUM CURRENT #1 Setpoint to the desired level.

Current Limit Only (Current Step) uses the Current Limit feature exclusively.

This method of starting eliminates the Soft Start voltage/current ramp and instead, maximizes the effective application of motor torque within the limits of the motor. In this mode, Setpoint RAMP TIME #1 is set to minimum so that the output current jumps to the current limit setting immediately. Typically used with a limited power supply when starting a difficult load such as a centrifuge or a deep well pump, when the motor capacity is barely adequate (stall condition or overloading occurs) or if other starting modes fail. Since ramp times are set to minimum, START RAMP #1 TYPE is set to either VOLTAGE or CURRENT.

### • Initial Torque (Initial Voltage #1 or Initial Current #1)

Sets the initial start point of either Voltage Ramp or the Current Ramp. Every load requires some amount of torque to start from a standstill. It is inefficient to begin ramping the motor from zero every time, since between zero and the WK2 breakaway torque level, no work is being performed. The initial torque level should be set to provide enough torque to start rotating the motor shaft, enabling a Soft Start and preventing torque shock damage. Setting this start point too high will not damage the starter, but may reduce or eliminate the soft start effect.

### • Ramp Time #1

Sets the maximum allowable time for ramping the initial voltage, current (torque) or power setting to either of the following:

- The Current Limit setting when the motor is still accelerating.
- Full output voltage if the Current Limit is set to maximum.
- kW if Power Ramp is selected.

Increasing the ramp time softens the start process by gradually increasing the voltage, current or power. Ideally, the ramp time should be set for the longest amount of time the application will allow (without stalling the motor). Some applications require a short ramp time due to the mechanics of the system. (i.e. centrifugal pumps, because pump problems can occur due to insufficient torque).

#### Current Limit

Sets the maximum motor current the starter will allow during the acceleration. As the motor begins to ramp, the Current Limit feature sets a maximum at which the current draw is held. Current Limit remains in effect until the following occurs:

- 1) The motor reaches full speed (Detected by the At-Speed detection circuit) or;
- 2) The Overload Protection trips on Motor Thermal Overload. Once the motor reaches full speed, the Current Limit feature becomes inactive. In the Voltage Ramp Profile, the voltage output is increased until it reaches the Current Limit. Ramp time is the maximum amount of time it takes for the voltage to increase until the Current Limit setting takes over. The Current Ramp profile varies the output voltage to provide a linear increase in current up to the Maximum Current Setpoint value. A closed loop feedback of motor current maintains the Current Ramp profile

SP2.4 Start Ramp 2 Type: Please refer to Ramp 1 settings for Ramp 2 Type: Voltage selection.

#### Start Ramp 2: Power

The **Power Ramp** feature has three programmable set points, Initial Power, Ramp Time and Maximum Power.

 The Initial Power set point allows the user to define an initial KW (motor power) value that will be applied to the motor when the start sequence is begun. It has a range of 0-100% and a default value of 20%.

It is recommended to use the power ramp on a loaded motor! Using the power ramp on an unloaded motor may result in shorter than anticipated acceleration times.

- The Ramp Time set point functions as all other ramp time set points and allows the user to define a time period during which the applied KW (motor power) will be increased linearly to the Maximum Power value set point. The adjustment range is 1 to 120 seconds. Once the Power Limit value is reached, the system enters a constant power mode that regulates the applied motor power until the motor reaches full speed.
- The Maximum Power set point has an adjustment range of 0-300% and a default value of 80%.

**Power Ramp Calculations:** The basic motor power value is derived from the line voltage and motor FLA, using a unity power factor as a default. This allows for approximation of the motor power rating without any other input data. During the Power Ramp process, the RMS line voltage, RMS motor current and power factor are measured on a cycle by cycle basis and applied to the Power Ramp algorithm. The CPU then calculates the True RMS motor power and will control the SCR firing to deliver the programmed power ramp values to the motor.

- **Initial Power**: The Initial power set point allows the user to define an initial KW (motor power) value that will be applied to the motor at the beginning of the start sequence.
- Ramp Time #2: See Ramp Time #1 for description
- **Maximum Power**: Sets the maximum motor power the starter will allow during the acceleration. As the motor begins to ramp, the "Maximum Power" sets a limit.

**SP2.5 Kick Start**: Used as an initial energy burst in applications with high friction loads.

- **Kick Start Voltage**: The initial voltage (as a percent of full voltage value) that is needed to start the motor. (i.e. Breakaway or Initial Torque.)
- Kick Start Time: The time the initial torque boost is applied.

**SP2.6 Deceleration**: Allows the motor to gradually come to a soft stop.

- Start Deceleration Voltage: Upon receiving a STOP command the output voltage initially drops to this voltage. (Represented as a percent of voltage value.)
- **Stop Deceleration Voltage**: The drop-off point of the deceleration ramp. (Percent of voltage value.) The point at which the unit output drops to zero to end the deceleration.
- Deceleration Time: The time to get to the stop Deceleration Voltage Set point value.

**SP2.7 Timed Output**: Used with an AUX (5-8) relay. When enabled, and upon a start command, it waits until the programmed time plus the run delayed time has expired. The relay energizes and remains so until a stop command is received. It de-energizes upon receiving a stop command.

**SP2.8 Run Delay Time**: Can be used with an AUX (5-8) relay. The delay timer begins upon receipt of the start command. The relay will then drop out when the time has expired.

**SP2.9 At Speed Delay Time**: Used with the AUX 4 relay, it energizes when the motor reaches At Speed and the programmed delay time has expired. The relay remains energized until a stop command has been received.

### SP.3 Phase & Ground Settings (Setpoint Page 3) (Security Level 2)

SP3.1 Imbalance Alarm Level: This is an advance warning of a phase imbalance problem. The problem may not be a fault in the motor, but merely caused by imbalanced voltages.

• Imbalance Alarm Delay: The amount of time the imbalance condition must exist before an alarm occurs.

SP3.2 Imbalance Trip Level: This will trip the motor on excessive phase imbalance. The trip level should be programmed to a higher value than the alarm level.

• Imbalance Trip Delay: The amount of time the imbalance condition must exist before a trip will occur.

SP3.3 Undercurrent Alarm Level: Typically used to warn of possible load loss, a coupling break or other mechanical problems.

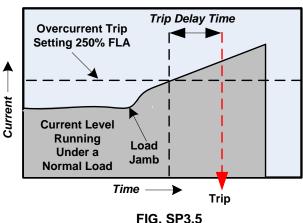

• Undercurrent Alarm Delay: The amount of time the undercurrent condition must exist before an alarm will occur.

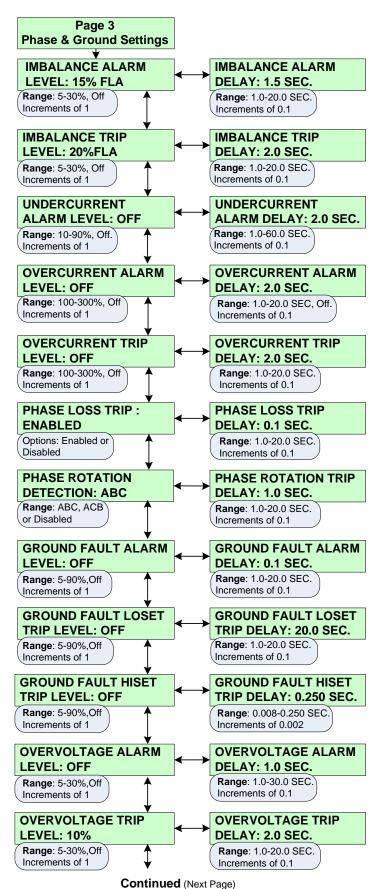

SP3.4 Overcurrent Alarm Level: Typically used to indicate when the motor is overloaded. This feature can be used to either stop the feed to the equipment or warn operators of an overload condition.

• Overcurrent Alarm Delay: The amount of time the overcurrent condition must exist before an alarm will occur.

**SP3.5 Overcurrent Trip Level**: Typically used to indicate the motor is severely overloaded and at which point a trip occurs.

• Overcurrent Trip Delay: The amount of time the overcurrent condition must exist before a trip will occur.

**SP3.6 Phase Loss Trip**: When enabled, the Soft Starter will trip the motor off-line upon a loss of phase power.

 Phase Loss Trip Delay: The amount of time the phase loss condition must exist before a trip will occur.

**SP3.7 Phase Rotation Detection:** The soft starter is continuously monitoring the phase rotation. Upon a start command, a trip will occur if it detects a change in the phase rotation.

• Phase Rotation: There are two possible phase rotation options: ABC or ACB. This Setpoint monitors the wiring to ensure that the phase rotation is correct. To view the present phase rotation, go to Metering Page1, screen number 4.

**SP3.8** \*Ground Fault Alarm: Typically used to warn of low level ground current leakage

• **Ground Fault Alarm Delay:** The amount of time that the ground fault condition must exist before an alarm will occur.

**SP3.9 \*Ground Fault Loset Trip Level:** Typically used to trip the motor on a low level of ground current leakage. This Setpoint is intended to detect high impedance faults.

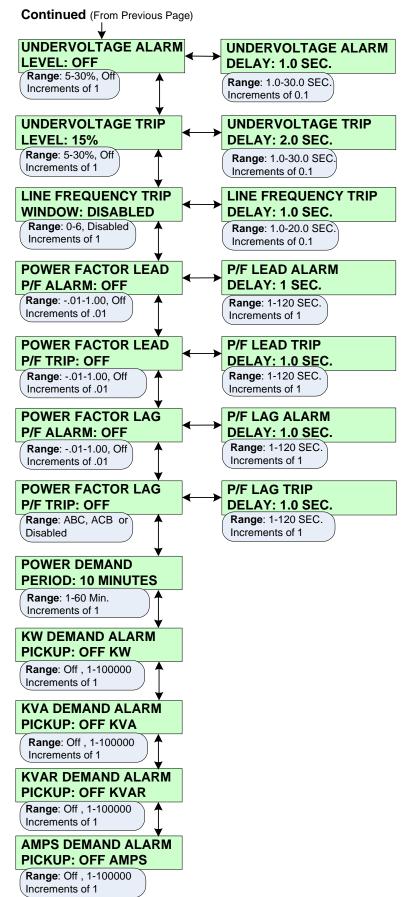

- **Ground Fault Loset Trip Delay:** The amount of time that the ground fault condition must exist before a trip will occur.
- \* Ground Fault Option must be installed

**SP3.10 \*Ground Fault Hiset Trip Level:** Used to trip the motor (within milliseconds) upon detecting a high level of ground current leakage. This Setpoint is intended to detect low impedance faults.

• \*Ground Fault Hiset Trip Delay: The amount of time that the ground fault condition must exist before a trip will occur.

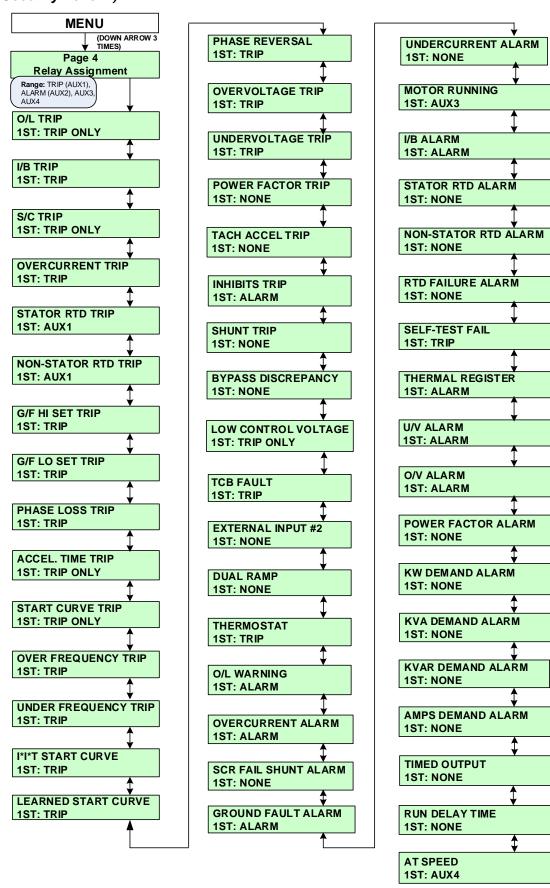

**SP3.11 Overvoltage Alarm Level:** Typically used to indicate when the line voltage is too high. This is an alarm level.

• Overvoltage Alarm Delay: The amount of time that the overvoltage condition must exist before an alarm occurs.

- SP3.12 Overvoltage Trip Level: Typically used to indicate that the line voltage is too high and at which point a trip occurs
- Overvoltage Trip Delay: The amount of time that the overvoltage condition must exist before a trip will occur.
- SP3.13 Undervoltage Alarm Level: Typically used to indicate when the line voltage is too low. This is an alarm level.
- Undervoltage Alarm Delay: The amount of time that the undervoltage condition must exist before an alarm occurs.
- **SP3.14 Undervoltage Trip Level:** Typically used to indicate that the line voltage is too low at which point a trip occurs.
- Undervoltage Trip Delay: The amount of time that the undervoltage condition must exist before a trip occurs.
- **SP3.15 Line Frequency Trip Window:** The acceptable amount of drift above or below the line frequency (Hz) before a trip is generated.
- Line Frequency Trip Delay: The amount of time that the frequency drift condition must exist beyond the window before a trip occurs.
- SP3.16 Power Factor Lead Alarm: Typically used to indicate a leading power factor.
- Power Factor Lead Alarm Delay: The amount of time that the power factor lead condition must exist beyond the window before an alarm occurs.
- **SP3.17 Power Factor Lead Trip:** The acceptable amount of power factor lead before a trip is generated.
- Power Factor Lead Trip Delay: The amount of time that the power factor lead condition must exist beyond the window before a trip will occur.
- **SP3.18 Power Factor Lag Alarm:** Typically used to indicate a lagging power factor.
- Power Factor Lag Alarm Delay: The amount of time that the power factor lagging condition must exist beyond the window before an alarm occurs.
- SP3.19 Power Factor Lag Trip: The acceptable mount of power factor lag before a trip is generated.
- Power Factor Lag Trip Delay: The amount of time that the power factor lag condition must exist beyond the window before a trip will occur.
- **SP3.20 Power Demand Period:** The Soft Starter monitors the demand of the motor based on several parameters (current, kW, kVAR, kVA). Monitoring the demand of the motor assist in the energy management program where processes can be altered or scheduled to reduce overall demand. Demand is calculated by taking samples of the output current, kW, kVAR and kVA over a period of time, then averaged and stored into memory.

# SP.4 Relay Assignment (Setpoint Page 4) (Security Level 2)

# SP.4 Relay Assignment (Setpoint Page 4) – Continued (Security Level 2)

All of the protective functions of the Soft Starter are user programmable to an output relay. The factory will ship with all tripping functions assigned to TRIP (AUX1) relay, and all alarm functions to ALARM (AUX2) relay.

Note: AUX1 - 4 are Factory Set and should not be changed.

**SP4.1** The following is a list of all the user programmable functions.

Note: The 1st Relay Assignments are factory defaults and should not be changed.

| RELAY ASSIGNMENTS                    |                             |              |              |

<sup>\*</sup>Ground fault option must be installed

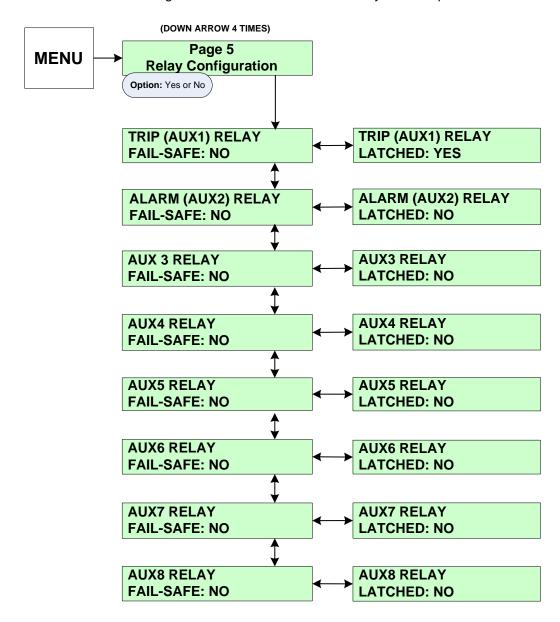

## SP.5 Relay Configuration (Setpoint Page 5) (Security Level 2)

In Setpoint Page 5 the user can configure the four output relays as either fail-safe or non fail-safe and latching or non-latching.

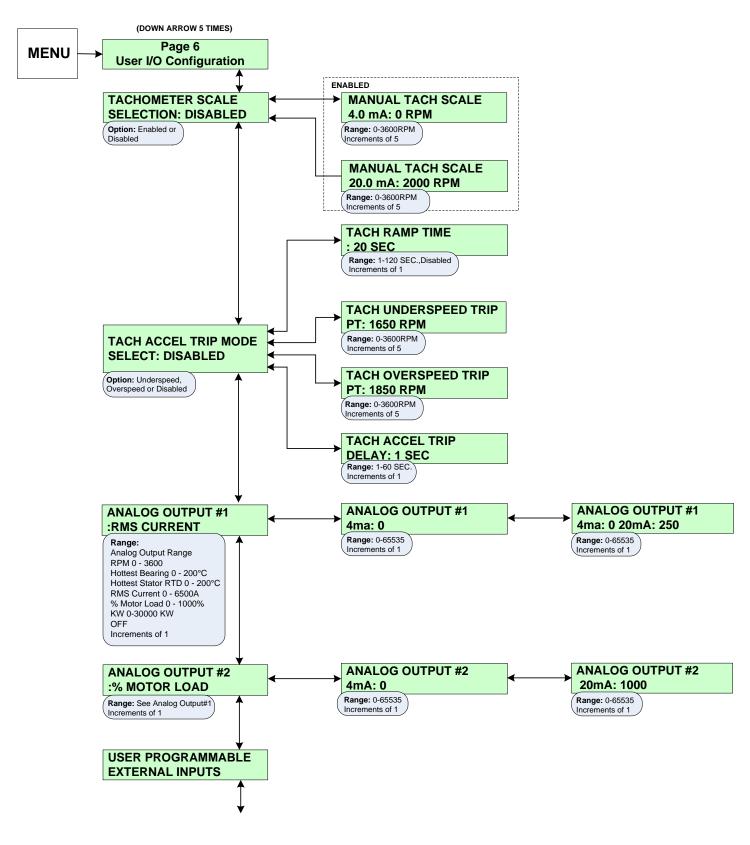

**SP5.1** When a relay has been configured for "Fail Safe" and power is applied to the unit the relay will energize and its contacts will change state. The relay will then de-energize and its contacts revert back when an event occurs of if power is removed.

**NOTE:** The relays in the soft starter will not prevent a start sequence unless they are wired in as interlocks. If power is lost, the motor power is also lost. Do not change the programming for AUX 1-4. These are for factory use only. AUX 5-8 are user defined outputs.

**SP5.2** A relay configured as non-latching will reset itself when the cause of the trip event is not continuous. The TRIP (AUX1) relay should always be programmed for latching, because this trip should require a visual inspection of the motor and starter before issuing a manual reset to release the relay after a trip has been stored.

## SP.6 User I/O Configuration (Setpoint Page 6) (Security Level 2)

Continue on page 51

### SP.6 User I/O Configuration (Setpoint Page 6) - Continued (Security Level 2)

The Soft Starter can be configured to accept a tachometer feedback signal using the 4-20mA input.

**SP6.1** The first screen of Setpoint page 6 is TACHOMETER SCALE SELECTION. When this is set to ENABLED, the user will need to input the tachometer scale of the 4-20mA input range.

- Manual Tach Scale 4.0 mA: The unit is looking for an RPM value to assign to the lowest point on the scale. This Value should represent the motor at zero speed.
- Manual Tach Scale 20.0 mA: The unit is looking for an RPM value to assign to the highest point on the scale. This value should represent the motor at full speed.

**SP6.2 Tach Accel Trip Mode Select:** When enabled, the underspeed or overspeed must be selected for the Tach Accel Trip. If underspeed is selected, only the Tach Underspeed Trip Point will be used. If overspeed is selected, only the Tach Overspeed Trip Point will be used.

- Tach Inhibit Time: This is the duration of time before the starter begins sampling the tachometer.
- Tach Underspeed Trip: Defines the minimum motor speed using the Tach feedback. When the underspeed trip
  mode is enabled and the motor speed falls below this level for the time specified by the Tach Accel Trip Delay an
  underspeed trip occurs.
- Tach Overspeed Trip: Defines the maximum allowed motor speed using the Tach feedback. When the overspeed
  trip mode is enabled and the motor speed exceeds this level for the time specified by the Tach Accel Trip Delay an
  overspeed trip occurs.
- Tach Accel Trip Delay: The duration of time that the Tach Accel trip condition must persist before a trip is generated.

**SP6.3** The controller provides two 4-20mA analog outputs. Each analog output is independent of the other and can be assigned to monitor different functions. The available output ranges are; RPM, Hottest Non-Stator (Bearing) RTD, Hottest Stator RTD, RMS current, and % Motor Load.

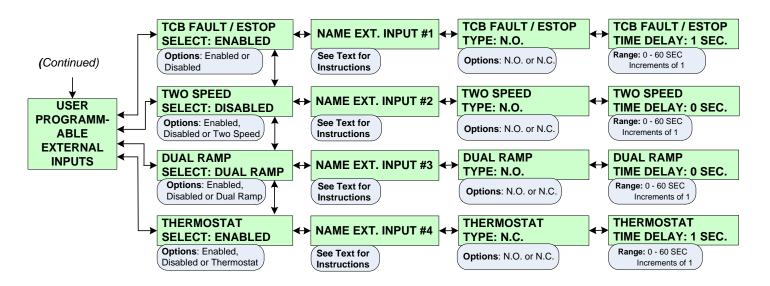

Analog Output #1 – Select a function from the available five options to be transmitted from the 4-20mA output.

**Note:** If selecting RPM, the Tachometer feedback input signal must be present in order for the controller to give proper output. If selecting RTD, the RTD option must be installed and an RTD input signal must be present for a proper output to be given from the analog output.

- Analog Output #1 (4 mA): Enter a value that the 4mA level will represent for the selected function; typically this value should be 0.
- Analog Output #1 (20 mA): Enter a value that the 20mA level will represent for the selected function.

**SP6.4 Analog Output #2** – All of the Setpoints and setup screens for Analog Output #2 are the same as those for Analog Output #1.

## SP.6 User I/O Configuration (Setpoint Page 6) - Continued (Security Level 2)

**SP6.5 User Programmable External Inputs**: The controller provides up to 4 digital external inputs which are individually programmable. A description name can be assigned to each individual input for easy identification.

- TCB FAULT / ESTOP: Factory programmed for TCB Fault/ESTOP. Input and can be enabled or disabled.
- TWO SPEED: Factory programmed for TWO SPEED. Input and can be enabled, disabled or Two Speed.
- External Input #3: The setup screens and Setpoints for External Input #3 includes the option of being configured for Dual Ramp. In Dual Ramp mode, the initial contact setting is the same as the START RAMP #1. Upon a change in input contact state, the controller will switch over to START RAMP #2 and use that setting for start control mode.

**Note:** The start RAMP types should only be switched while the motor is stopped. In Setpoint Page 4 Relay Assignments do not assign any output relay to this function. The controller is programmed with External input #3 programmed for dual ramp. If it is not needed, disable the dual ramp.

External Input #4: Thermostat input and can be enabled, disabled or thermostat.

**Note:** It is recommended that this function remain enabled. If the thermostat indicates an over temperature condition, the controller will trip the motor.

**External Input #1, #2, #3, #4 Time Delay:** Upon a change in contact setting, the unit will wait the programmed amount of time before generating an output. If no delay is needed, then input 0 seconds. The controller will post an event upon seeing a change in state.

External Input #1, #2, #3, #4 Type: The external input can be set as either a normally open or normally closed contact.

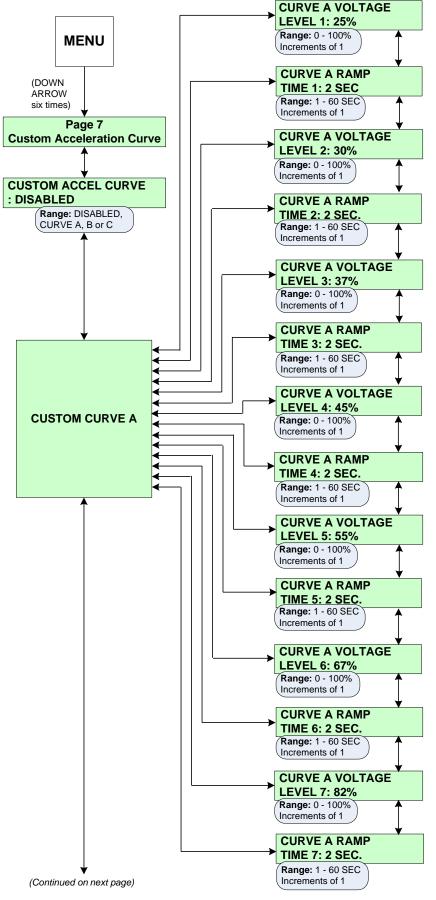

Name Ext. Input #1, #2, #3, #4: The user can assign a description name to the input. Up to 15 characters including spaces can be used to assign the name.

## SP.7 Custom Acceleration Curve (Setpoint Page 7) (Security Level 3)

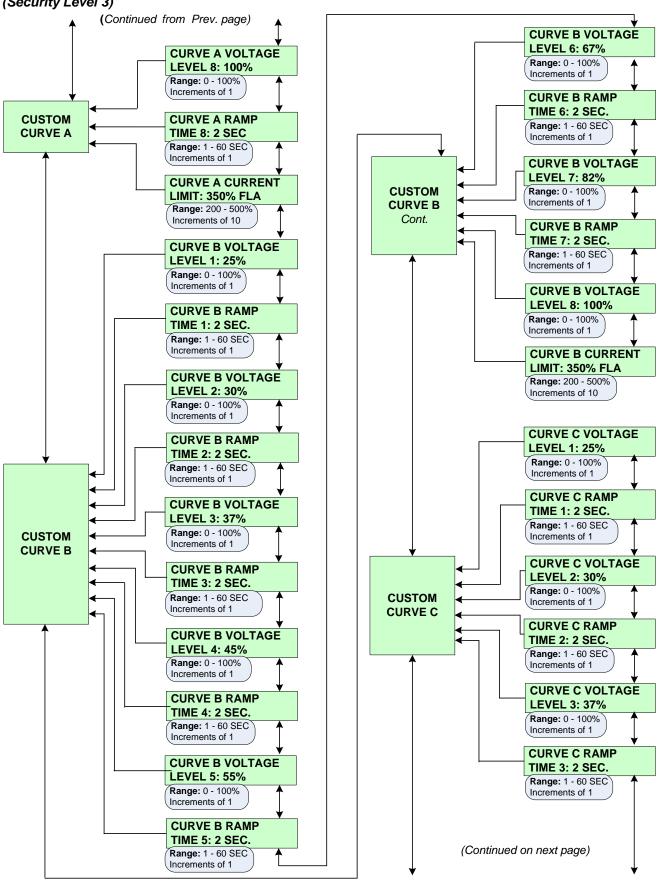

SP7.1 Setpoint Page 7 allows the user to custom design the acceleration curve (start curve) for a specific application. The custom design setup allows for up to three different curves in the Soft Starter. Only one curve can be active (enabled) at any given time. Each of the three curves allow for eight voltage plotting points, with corresponding ramp times and a current limit setting.

**Note:** Each successive voltage level must be programmed to a voltage level equal to or greater than the previous level. All eight voltage levels must be programmed and the eighth level has been preset at 100%.

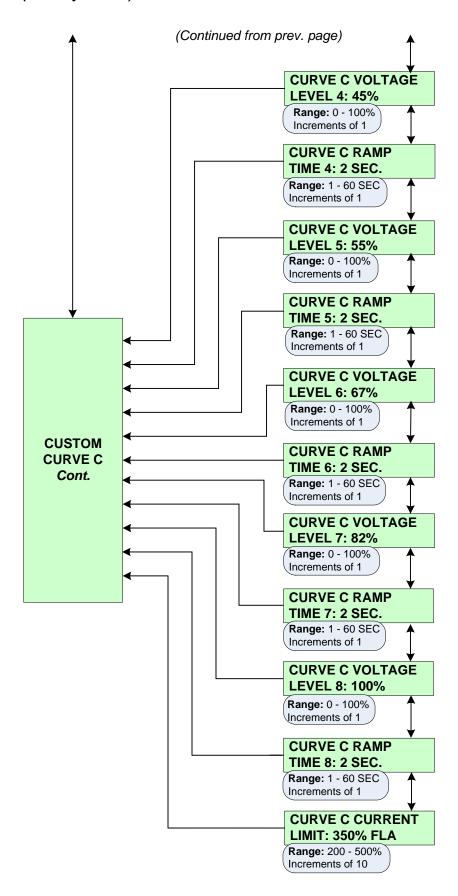

• If Custom Accel Curve has been set to curve A, B or C on this page, the Soft Starter will override the Start Control Mode selected in Setpoint Page 2, (even if Start Control Mode in Setpoint Page 2 has not been set to Custom Accel Curve).

### SP.7 Custom Acceleration Curve (Setpoint Page 7) - Continued (Security Level 3)

### SP.7 Custom Acceleration Curve (Setpoint Page 7) - Continued (Security Level 3)

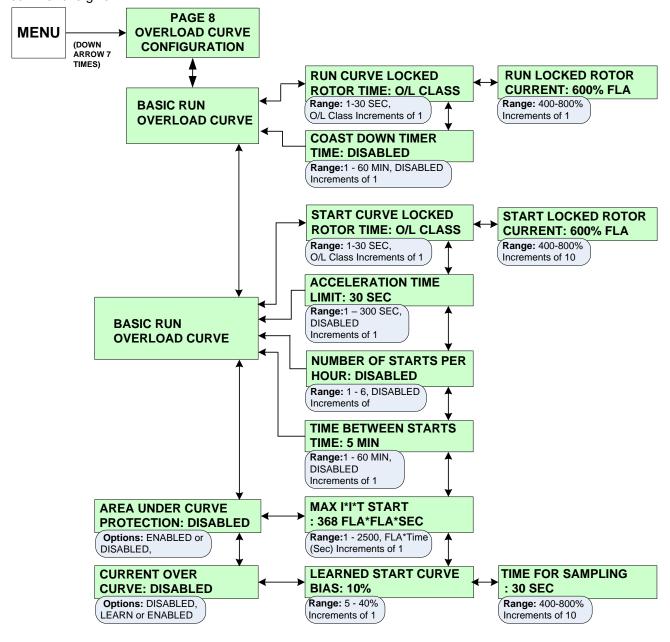

## SP.8 Overload Curve Configuration (Setpoint Page 8) (Security Level 3)

Configures the unit's start and run protection mode. The unit has independent start and run curve protection and the settings can be based on the OL Class or set by the motor's locked rotor current and time.

#### SP8.1 Basic Run Overload Curve

- Run Curve Locked Rotor Time: Set the locked rotor time to the OL Class default chosen in Setpoint Page 1 or set the time in seconds. This is the time the locked rotor condition exists before a trip occurs.
- Run Locked Rotor Current: The current the motor draws with full voltage on the windings and no rotor movement (as a percent of motor FLA). Refer to the nameplate data or contact the motor manufacturer.
- Coast Down Timer: If enabled, this prevents the motor from restarting for the programmed amount of time, after a stop command is given.

#### SP8.2 Basic Start Overload Curve

- Start Curve Locked Rotor Time: The locked rotor time can be set to the OL Class default chosen in Setpoint Page 1 or to a specific time. The overload condition must exist for the programmed amount of time before a trip occurs.
- Start Locked Rotor Current: The current the motor draws with full voltage on the windings and no motor movement (as a percent of motor FLA). Refer to the motor nameplate data or contact the motor manufacturer.
- Acceleration Time Limit: If the motor does not enter run mode (reach "at speed") within the preset time, the unit trips
  on acceleration time limit.
- **Number of Starts per hour:** If enabled, this limits the maximum number of starts permitted per hour. This Setpoint allows a maximum of 6 starts per hour. Contact the motor manufacturer for further information regarding number of starts per hour.
- **Time Between Starts:** If enabled, the soft starter prevents another start attempt until the programmed time has expired.

**SP8.3 Area Under Curve Protection:** If enabled, this secondary start protection uses both the basic start protection and the area under the curve protection.

• Max I\*I\*T Start: The maximum I²t allowed during start. If the I²t to start exceeds this number then the Soft Starter will generate a trip.

**SP8.4 Current Over Curve:** Learns the motor's starting characteristics and protects the motor based upon the learned curve. It is useful when commissioning a new motor.

- **Learn:** The unit reads the motor's starting characteristics. Start the motor and allow it to come to full speed. The start feedback enables the motor protection based on the learned start curve.
- Learned Start Curve Bias: The maximum allowed deviation above or below the start curve before a trip is generated.
- Time for sampling: The time the soft starter continues to sample the start curve characteristic during learn mode.

## SP.9 RTD Option Configuration (Setpoint Page 9) (Security Level 3)

Note: The RTD is an option. Contact factory for additional information.

The Soft Starter is available with an optional RTD card that provides 12 programmable RTDs which are individually programmable for type. The available types are 100 ohm platinum, 100 ohm nickel, 120 ohm nickel and 10 ohm copper. Each RTD can be identified with a description name of up to 15 characters (including spacing). Also, each individual RTD has its own alarm and trip level.

#### **SP9.1 Use NEMA Temp for RTD Value:**

When this Setpoint is enabled, the Soft Starter will use the NEMA design insulation class to limit the maximum allowed range of the alarm and trip level. The maximum allowed temperature range is 240° C or (464°F).

#### SP9.2 Number Of RTD'S Used for Stator:

Up to six RTDs can be assigned to monitor the stator of the motor.

#### SP9.3 RTD Voting:

When this is enabled, the Soft Starter will not post a trip until 2 RTD's have exceeded the trip level. This prevents nuisance RTD tripping.

#### SP9.4 RTD Setup:

Each of the 12 RTDs is configured in the following manner. The first column is the RTD type, the second column is the RTD description, the third column is the alarm level, and the fourth column is the trip level. The first six RTDs have been pre-programmed with a description name for the STATOR, with two RTDs per phase.

RTDs #1 & #2 have been named STATOR PHASE A1 and A2 respectively. RTDs #3 & 4 are named STATOR PHASE B1 and B2, RTDs #5 & 6 are named STATOR PHASE C1 and C2.

If other description names are required, press the right arrow button from the RTD Type screen to go the RTD description screen. If no alarm or trip level is required these Setpoints can be turned off.

#### **RTD Available Settings:**

#### **RTD TYPE:**

- 120 OHM NICKEL (NI)
- 100 OHM NICKEL (NI)
- 10 OHM COPPER (CU)
- 100 OHM PLATINUM (PT)
- OFF

ALARM LEVEL: OFF or 0 - 240C (32-464F) Example: ### C = ### F, Increments of 1

#### RTD DESCRIPTION:

STATOR A1, STATOR A2, STATOR B1, STATOR B2, STATOR C1, STATOR C2, FRONT BEARING, BACK BEARING, BEARING BOX, AMBIENT, NONE

**RTD ALARM DELAY:** Entry allows the enunciation of the Alarm condition to be delayed by the set time to ensure an alarm condition persists.

Factory Setting = 5 sec.

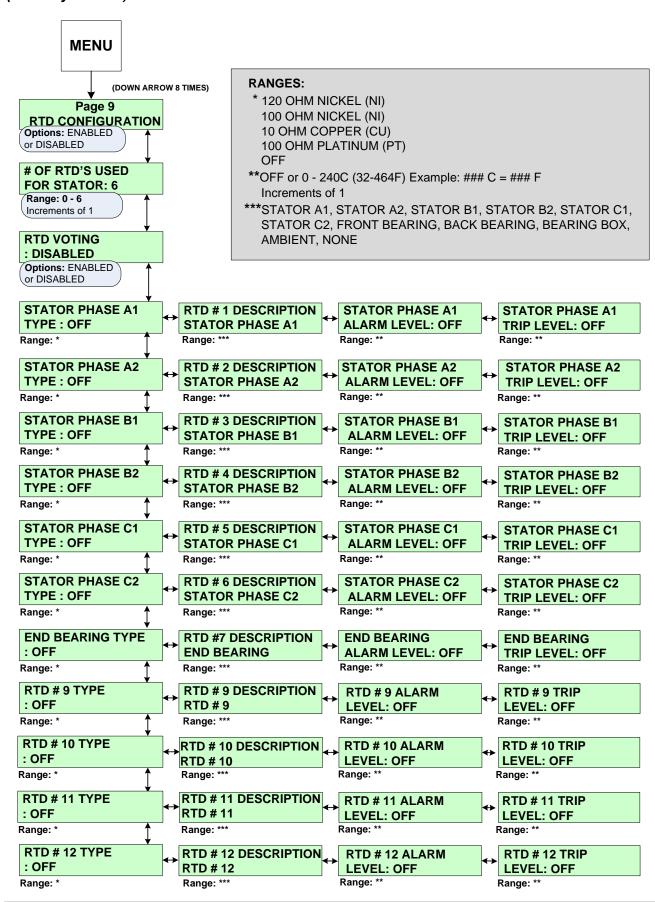

Range = 1 - 60 sec.

RTD TRIP DELAY: This entry will allow the RTD Trip function to be delayed by the set time.

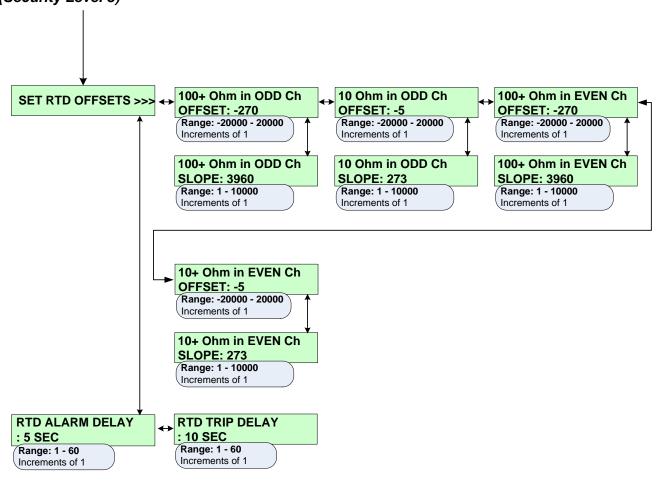

Factory Setting = 10 sec.

Range = 1 - 60 sec.

## SP.9 RTD Option Configuration (Setpoint Page 9) - Continued (Security Level 3)

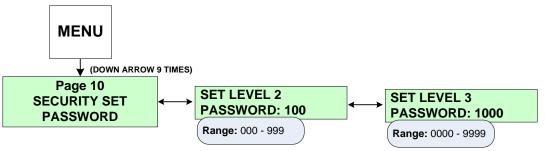

SP.9 RTD Option Configuration (Setpoint Page 9) - Continued (Security Level 3)

## SP.10 Set Password (Setpoint Page 10) (Security Level 3)

The soft starter has three levels of user programmable setpoint screens. Level one setpoints do not require a password because the data contained in level one is basic nameplate data and starter control. Level two setpoint screens require a three-digit password to configure the protection schemes. Level three setpoint screens require a four-digit password to access the full range of protection and starter schemes.

SP10.1 Set Level 2 Password: This level uses a 3-digit password. The default level 2 password is 100.

SP10.2 Set Level 3 Password: Level three uses a 4-digit password. The default level 3 password is 1000.

## SP.11 Communications (Setpoint Page 11) (Security Level 3)

**SP11.1 Set Front Baud Rate:** Configures the RS232 communications baud rate.

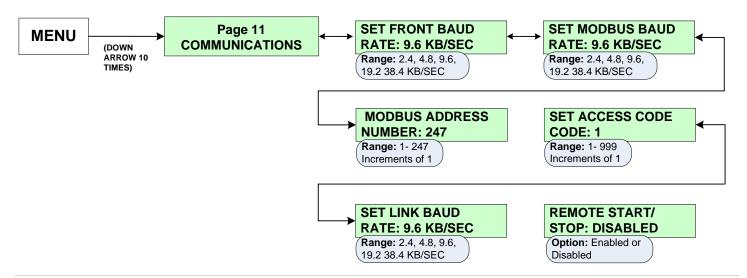

SP11.2 Set Modbus Baud Rate: Configures the Modbus communications baud rate

**SP11.3 Modbus Address Number:** Assigns a Modbus address to the unit.

SP11.4 Set Access Code: Assigns an access code to the Modbus addressing. This is typically not used

**SP11.5 Set Link Baud Rate:** Configures the RS422 communications baud rate between the keypad operator and the CPU board (For applications with remote keypad only).

**SP11.6 Remote Start/Stop:** Allows the RS485 Modbus communications to start and stop the motor. Contact factory for details.

### SP.12 System Setpoints (Setpoint Page 12) (Security Level 3)

**SP12.1 Default Display Screen:** This Setpoint group allows the user to choose the default screen the Soft Starter displays while the motor is running. Select the metering page number (1-3), then, select the metering screen number. The range varies depending on the selected page. To display a default screen, program the following two Setpoints:

- Metering Data Page#: Range is Page 1 3.
- Metering Data Screen#: If Page 1 is selected as the default page, then Screens 1- 10 are available. If Page 2 Screens 1-29 are available. If Page 3 is selected then Screens 1-6 are available. (See Metering Menu, MP.1, for screen number assignment.)

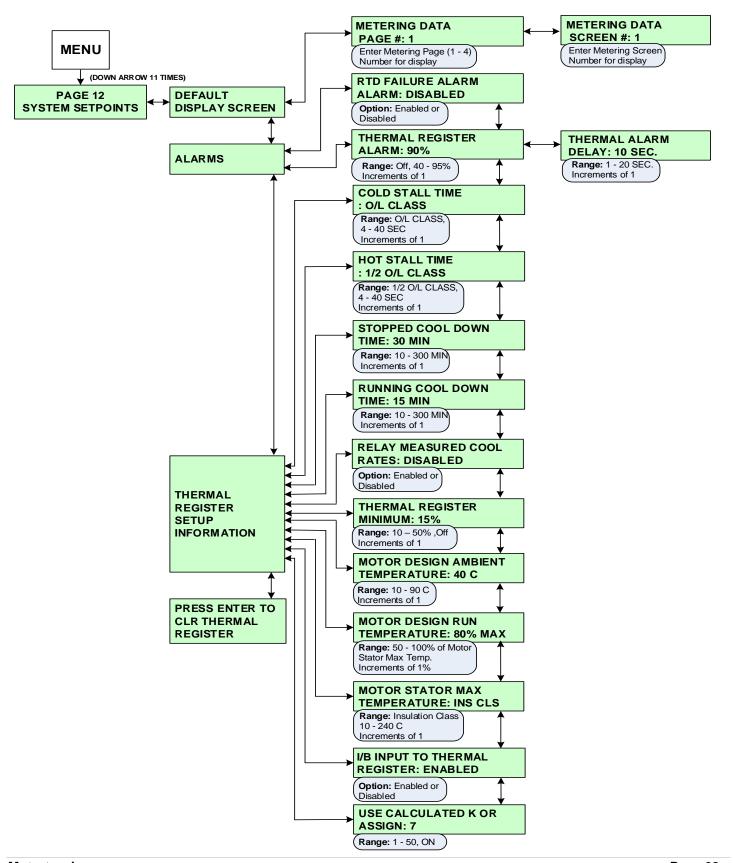

SP12.2 Alarms: Configures the RTD failure alarm (when RTD option is included) and the thermal register alarm.

- RTD Failure Alarm: If enabled, and an RTD shorts or open, an alarm occurs. (Only if RTD option is installed).
- Thermal Register Alarm: Sets a level in the thermal register to generate an alarm when the Thermal Register Capacity Used has exceeded this level.
- Thermal Alarm Delay: The amount of time that the Thermal Register Used must exceed the Setpoint before an alarm condition will occur.

**SP12.3 Thermal Register Setup Information:** This Setpoint group will configure the thermal register and indicate to the soft starter which inputs to use when thermal modeling.

- **Cold Stall Time:** Enter the time from the motor manufacturer's specification sheet or use the time defined by the OL Class. This Setpoint is used to define the thermal capacity of the motor.
- Hot Stall Time: Enter the amount of time specified by the motor manufacturer or use half of the time defined by the OL Class.
- **Stopped Cool Down Time**: The time the motor needs to cool down after it has stopped. Use only the data provided by the motor manufacturer. This Setpoint is used to configure the cooling rate of the thermal register.
- Running Cool Down Time: The amount of time the motor needs to cool down while running. Use only the data provided by the motor manufacturer.
- Relay Measured Cool Rates: When the RTD option is supplied, the Soft Starter can be configured to use the
  measured cooling rates from the RTDs instead of the programmed settings. This Setpoint should only be enabled
  when the RTD option is present.
- **Thermal Register Minimum:** Sets the value in the thermal register which represents a motor running at the nameplate current (with no overheating or negative sequence currents present).
- **Motor Design Ambient Temperature:** Use the data from the motor manufacturer's specifications. When RTD option is supplied, this Setpoint will be the base point for the RTD biasing of the Thermal Register.
- **Motor Design Run Temperature:** Use the data from the motor manufacturer's specifications. This Setpoint defines the operating temperature rise of the motor at full load amps or 100% load.
- Motor Stator Max Temperature: This represents the maximum temperature the stator insulation will withstand. The
  user may choose to use the temperature setting of the insulation class (selected in Setpoint Page 1) or enter a
  specific maximum temperature. This value should not exceed the stator's insulation temperature. This maximum
  temperature represents 100% thermal capacity.
- **U/B Input to Thermal Register:** Always enabled. It allows the soft starter to use the line current imbalance information to bias the Thermal Register.

- **User Calculated K or Assign:** When the Setpoint is set to ON, the soft starter will calculate the k constant factor for biasing the thermal register, or the user may choose to assign the k value.
- SP12.4 Press Enter to CLR Thermal Register: Allows the level three password user to clear the thermal register for emergency restarts.

### SP.13 Calibration & Service (Setpoint Page 13)

### (Security Level 3)

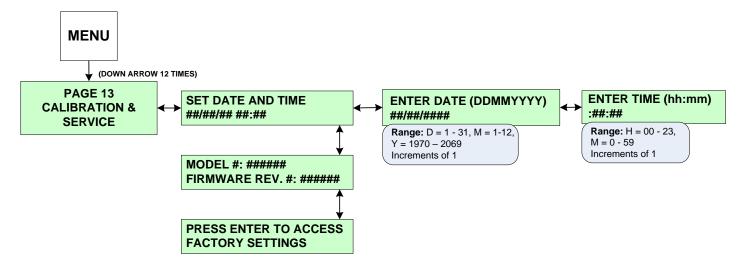

Certain screens are displayed for user information only, such as Current date and time, Model number and Firmware revision number. Setpoint changes in this page will only be accessible to factory personnel.

SP13.1 Set Date and Time: Displays the date and time.

- Enter Date (DDMMYYYY): Allows the factory personnel to program the date for the soft starter in the format shown.
- Enter Time (HH:MM): Allows the factory personnel to program the time for the soft starter.

SP13.2 Model & Firmware #: Displays the model number and firmware revision in the soft starter.

SP13.3 Press Enter to Access Factory Settings: Available to qualified personnel.

### **Chapter 6 - Metering Pages**

The Soft Starter offers performance metering which gives the user the ability to view information about the motor and the unit.

### 6.1 Metering Page List

The following charts list each Metering Page and the functions within that page. The applicable section of the manual is also referenced.

6.1.1 Metering Menu & Data (Metering Page 1)

| Metering<br>Page        | Description of Display  | Screen |
|-------------------------|---|--------|
| a                       | Phase A, B, C and Ground Fault (Option)                                     | 1      |
| Data                    | Average current of the % of imbalance and the motor's RPM (Tach Option)     | 2      |
| ∞ ∞                     | Motor load as a percentage of motor FLA                                     | 3      |
| 1<br>u 8                | Line frequency and present phase sequence                                   | 4      |
| ii<br>e                 | Percentage of remaining Thermal Register                                    | 5      |
| ₽AG                     | Thermal capacity required to start the motor                                | 6      |
| P<br>ng                 | Average time required to start  | 7      |
| eri                     | Average current during start  | 8      |
| PAGE 1<br>Metering Menu | Measured I2T required to start the motor                                    | 9      |
| 2                       | Amount of time required to start the motor during the last successful start | 10     |

6.1.2 Metering (Metering Page 2)

| Metering Page      | Description of Display                           | Screen |
|--------------------|--|--------|
|                    | Phase A, B, C currents and Power Factor          | 1      |
|                    | Phase A, B, C currents and Ground Fault (Option) | 2      |
|                    | Displays KW and KVA                              | 3      |
|                    | Displays KVAR and Power Factor                   | 4      |
| PAGE 2<br>Metering | Displays Peak ON and KW Demand                   | 5      |
| E G                | Displays Peak ON and KVA Demand                  | 6      |
| P P                | Displays Peak ON and KVAR Demand                 | 7      |
|                    | Displays Peak ON and Amps Demand                 | 8      |
|                    | Clears Demand values                             | 9      |
|                    | Displays Megawatt hours used                     | 10     |
|                    | Press enter to clear statistics on MWH values    | 11     |

6.1.3 RTD Option Values (Metering Page 3)

| Metering<br>Page     | Description of Display   | Screen |
|----------------------|--|--------|
|                      | Hottest stator RTD (#1 - 6)  | 1      |
| 60                   | Hottest non-stator RTD (#7 - 12)                                   | 2      |
| PAGE 3<br>RTD Values | Temperature of start phase A1 in °C and °F                         | 3      |
| ä<br>al              | Maximum temperature for RTD #1                                     | 4      |
| AG                   | Same as Screens 3 - 4 for RTDs #2 - 12                             | 5 - 26 |
| P TX                 | Clear the maximum temperature register (Level 3 password required) | 27     |
| <u> </u>             | Measured running thermal stabilization time of motor (in minutes)  | 28     |
|                      | Measured stopped cooling time (to ambient) of motor (in minutes)   | 29     |

6.1.4 Status (Metering Page 4)

| Metering<br>Page | Description of Display                                       | Screen |
|------------------|--|--------|
|                  | Current status   | 1      |
| 4 "              | Amount of time remaining before an overload trip occurs      | 2      |
| T X              | Amount of time remaining from a thermal inhibit signal       | 3      |
| PAGE 4<br>Status | Coast down time remaining                                    | 4      |
| <u> </u>         | Amount of time remaining before a start command can be given | 5      |
|                  | Excessive number of starts per hour                          | 6      |

6.1.5 Event Recorder (Metering Page 5)

| Metering<br>Page          | Description of Display   | Screen |
|---------------------------|--|--------|
| و . ت                     | Displays the event with date and time (Up to 60 events)                      | 1      |
| AGE 5<br>Event<br>ecorder | Displays Phase A, B, C current values, Ground Fault (Option) at time of trip | 1A     |
| PA<br>Ev                  | Displays Vab, Vbc, Vca and Power Factor at time of trip                      | 1B     |

6.1.6 Last Trip (Metering Page 6)

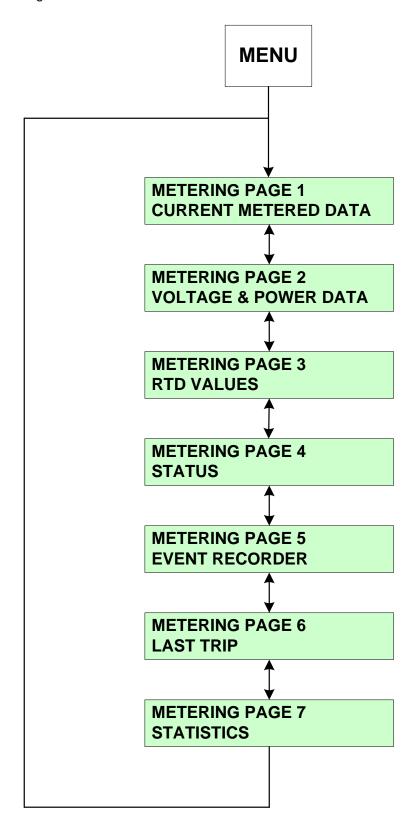

| Metering<br>Page    | Description of Display                         | Screen |
|---------------------|--|--------|
|                     | Cause of last trip                             | 1      |
| 9<br><u>d</u>       | Measured phase current                         | 2      |
| 삤ᆫ                  | Measured voltage and power factor              | 3      |
| PAGE 6<br>Last Trip | Imbalance percentage, the frequency and the kW | 4      |
| <u>Р</u>            | Hottest stator RTD temperature                 | 5      |
|                     | Hottest non-stator RTD temperature             | 6      |

6.1.7 Statistics (Metering Page 7)

| Metering<br>Page     | Description of Display  | Screen |
|----------------------|---|--------|
| PAGE 7<br>Statistics | Total Megawatt Hours  | 1      |
|                      | Accumulated Total Running Hours   | 2      |
|                      | Clear the Total Running Hour Count  | 3      |
|                      | Total Number of Trips / Number of Short CircuitTrips                            | 4      |
|                      | Number of Start and Run Overload Trips since the last statistical data clearing | 5      |
|                      | Number of frequency and Current Imbalance trips                                 | 6      |
|                      | Number of Over Current Trips  | 7      |
|                      | Stator and Non-Stator RTD Trips   | 8      |
|                      | Ground Fault Hiset and Loset Trips  | 9      |
|                      | Acceleration Time Trips   | 10     |
|                      | Start Curve Trips   | 11     |
|                      | I <sup>2</sup> T Start Curve Trips  | 12     |
|                      | Learned Start Curve Trips   | 13     |
|                      | Shunt Trip Trips  | 14     |
|                      | Phase Loss Trips  | 15     |
|                      | Tach Acceleration Trips   | 16     |
|                      | Undervoltage and Overvoltage Trips  | 17     |
|                      | Power Factor Trips  | 18     |
|                      | Phase Reversal Trips  | 19     |
|                      | Low Control Voltage Trips   | 20     |
|                      | Ext Inp #1 Trips  | 21     |
|                      | Ext Inp #2 Trips  | 22     |
|                      | Ext Inp #3 Trips  | 23     |
|                      | Ext Inp #4 Trips  | 24     |
|                      | Press ENTER to Clear Statistics   | 25     |

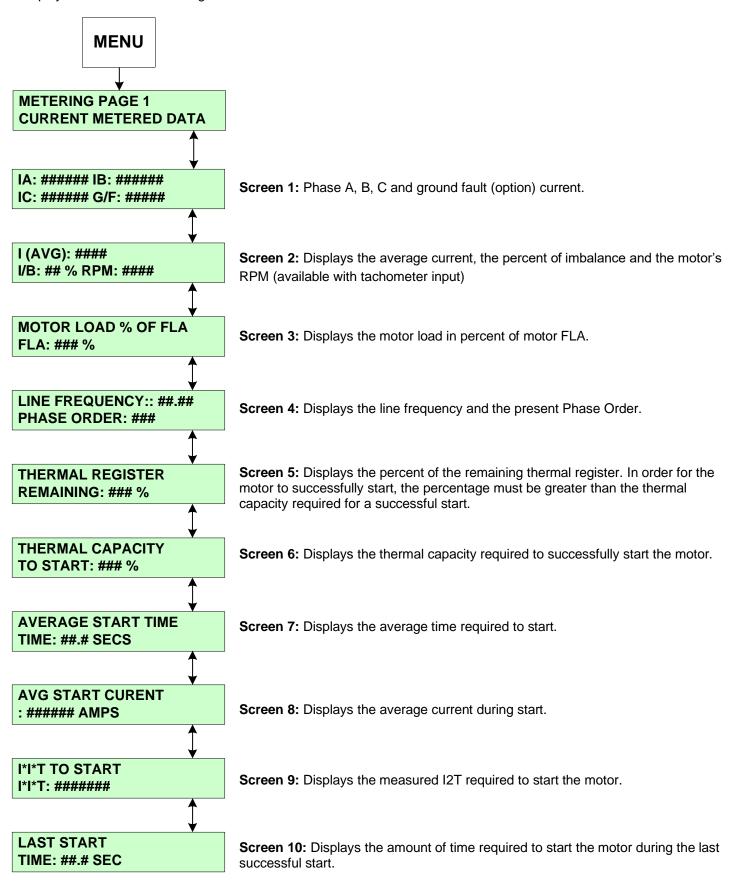

### 6.2 Metering Menu and Explanation

Push MENU key to toggle the screens between Setpoint Menu and Metering Menu and follow the arrow keys to get to different screens.

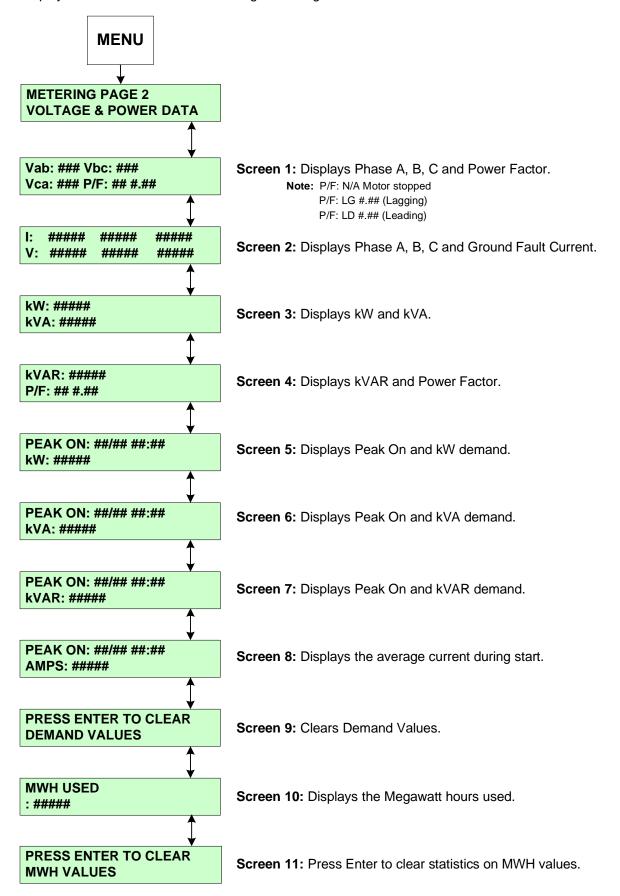

### MP.1 Metering (Metering Page 1)

Displays basic current metering data.

### MP.2 Metering (Metering Page 2)

Displays the soft starter statistical voltage metering information

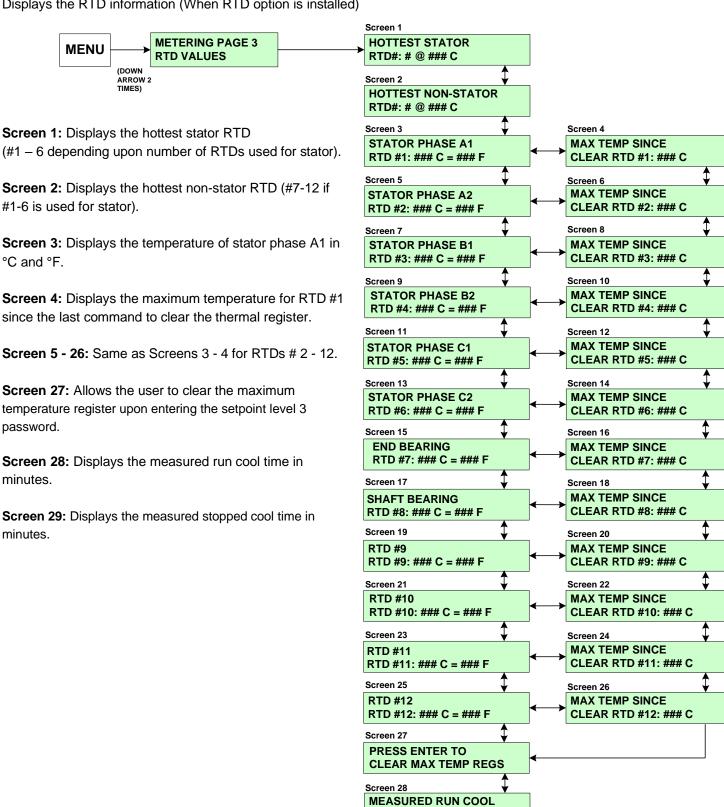

### MP.3 Metering (Metering Page 3)

minutes.

minutes.

Displays the RTD information (When RTD option is installed)

**Motortronics** Page 69

TIME: ### MIN

**MEASURED STOPPED** COOL TIME: ### MIN

Screen 29

# MP.4 Metering (Metering Page 4)

Displays the present status of the soft start

\*Screen 1: Displays the present state of the unit as follows:

**Screen 2:** Displays the amount of time remaining before an overload trip will occur.

**Screen 3:** Displays the amount of time remaining from a thermal inhibit. The inhibit time comes from the amount of thermal register remaining versus the amount of thermal capacity required to start.

**Screen 4:** Displays the coast down time remaining (Backspin time). The time remaining depends upon the user setting in Setpoint Page 8, Coast Down Time.

**Screen 5:** Displays the amount of time remaining before a start command can be given. The time remaining depends upon the setting in Setpoint page 5.

**Screen 6:** If the number of starts per hour has exceeded the setting in Setpoint page 8.

\* NOTE: Screen 1 CURRENT STATUS Screens include:

MOTOR STOPPED READY TO START

MOTOR STARTING MULT. OF FLA

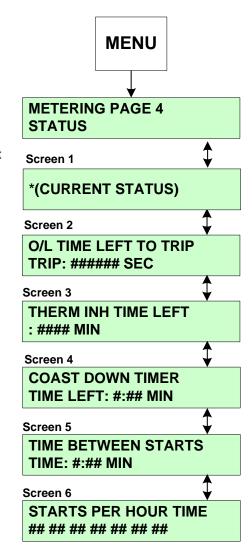

MOTOR RUNNING AT ###.## X FLA

LAST TRIP CAUSE NONE (or trip cause)

PROGRAMMING SETPOINTS

MOTOR STATUS
UNKNOWN STATE ###

(Displays relay state upon error)

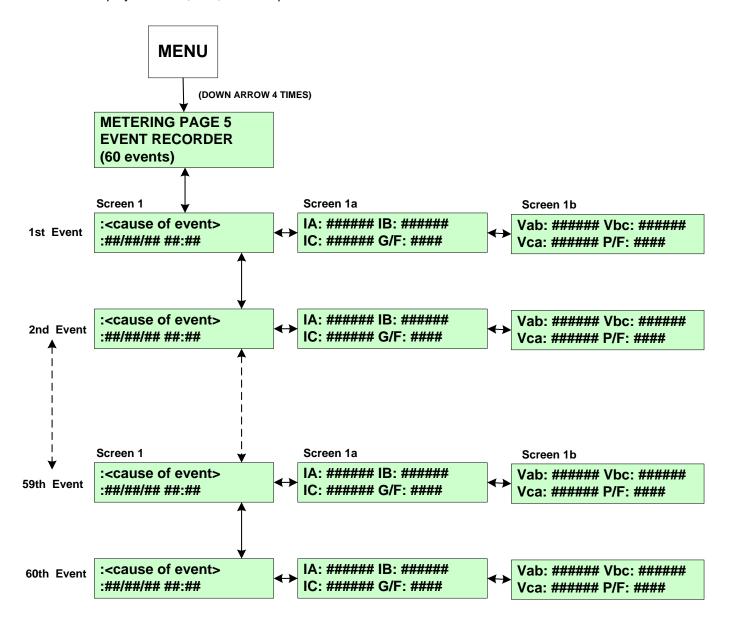

#### MP.5 Metering (Metering Page 5)

Displays the present status of the soft start

Screen 1: Displays the event (i.e., Imbalance Trip) with the date and time it occurred.

**Screen 1a:** Displays the current at Phase A, B, C and the ground fault at the time of the event. (*Note:* Ground fault option must be present)

**Screen 1b:** Displays the Vab, Vbc, Vca and power factor at the time of event.

All events will be viewed from oldest event in buffer to most recent event.

NOTES-

# MP.6 Metering (Metering Page 6)

Displays the last trip information

**Screen 1:** Displays the cause of the last trip.

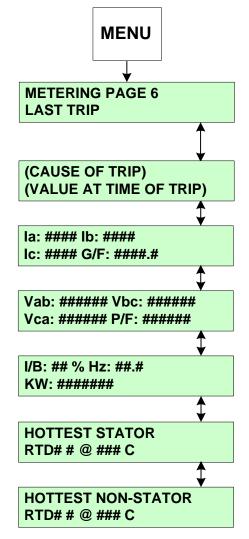

**Screen 2:** Displays the measured phase current at the time of the trip.

**Screen 3:** Displays the Vab, Vbc, Vca and power factor at the time of trip.

**Screen 4:** Displays the imbalance percentage, the frequency and the kW at the time of the trip.

**Screen 5:** Displays the hottest stator RTD temperature (when RTD option present) at time of the trip.

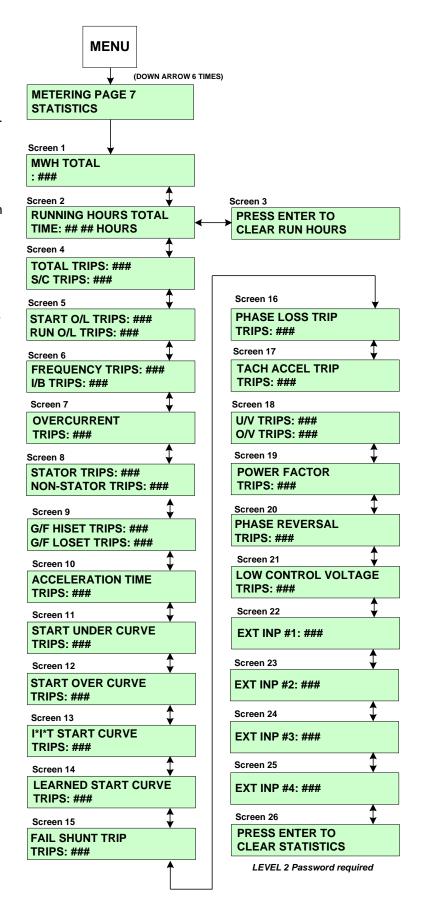

**Screen 6:** Displays the hottest non-stator RTD temperature (when RTD option present) at the time of the trip.

# MP.7 Statistics (Metering Page 7)

Displays the statistical trip information

- **Screen 1:** Displays the total of megawatt hours.
- **Screen 2:** Displays the accumulated total running hours.
- **Screen 3:** Clears the total running hour count.
- **Screen 4:** Displays the total number of trips since the last clearing of the statistical data and the total number of short circuit trips.
- **Screen 5:** Displays the number of start overload and run overload trips since the last clearing of the statistical data.
- **Screen 6:** Displays the number of frequency trips and Imbalance trips.
- Screen 7: Displays the number of overcurrent trips
- **Screen 8:** Displays the number of Stator and non-Stator RTD Trips
- **Screen 9:** Displays the number of Ground Fault Hi and Lo Set trips
- **Screen 10:** Displays the number of acceleration time trips.
- **Screen 11:** Displays the number of start under curve trips
- **Screen 12:** Displays the number start over curve trips
- Screen 13: Displays the number of I2T start curve trips
- **Screen 14:** Displays the number of learned start curve trips.
- **Screen 15:** Displays the number of fail shunt trips.
- Screen 16: Displays the number of phase loss trips.
- **Screen 17:** Displays the number of tachometer acceleration trips.
- **Screen 18:** Displays the number of undervoltage and overvoltage trips.
- **Screen 19:** Displays the number of power factor trips.
- **Screen 20:** Displays the number of phase reversal trips.
- **Screen 21:** Displays the number of low control voltage trips.
- **Screen 22:** Displays the number of external input #1 trips.
- **Screen 23:** Displays the number of external input #2 trips.
- **Screen 24:** Displays the number of external input #3 trips.
- **Screen 25:** Displays the number of external input #4 trips.
- **Screen 26:** Requires a Security Level 2 password to clear the statistics.

# **Chapter 7 - Maintenance and Troubleshooting**

The Soft Starter is designed to be a maintenance-free product. However, as with all electronic equipment, the unit should be checked periodically for build-up of dirt, moisture or industrial contaminants. These can cause high voltage arc-over, carbon tracking or prevent proper cooling of the SCR heat sinks. All bolts should be checked annually for proper tightness using an accurate torque wrench. According to the manufacturer's manual, check the contactor for air gap spacing of the vacuum bottles.

**Note:** If the unit is installed in a contaminated environment and forced air cooling is used, blower filters must be checked and cleaned regularly to insure proper air flow and cooling of the enclosure.

#### 7.1 Failure Analysis

When a fault occurs, the LCD will display the fault error while the listed LED and AUX Relay will be lit. Please clear all faults before attempting to restart the unit.

**Note:** If the problem persists after the required programming changes have been made, and all corrective action has been taken, please contact the factory for assistance.

**7.1.1 - SCR Testing Procedure**Perform the SCR Heat Sink Ohm test on each Stack Assembly.

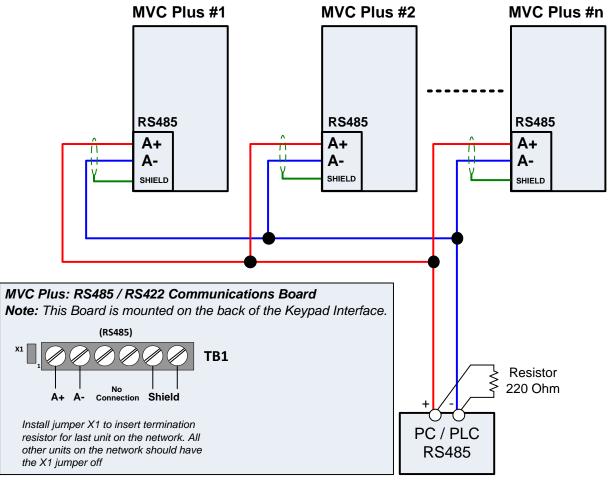

| Test Points         | OHM Meter Reading                   | Test Results                |
|---------------------|-------------------------------------|-----------------------------|
| From Position A to  | Greater than 10K Ohm                | Pass                        |
| Position B          | Less than 5K Ohm                    | Fail                        |
| From Position B to  | Greater than 10K Ohm                | Pass                        |
| Position C          | Less than 5K Ohm                    | Fail                        |
| Gate (G) to Cathode | 8 to 50 Ohms                        | Pass (Typical 8 to 20 Ohms) |
| (K) for each SCR    | Less than 8 or greater than 50 Ohms | Fail                        |

#### Notes

- 1 Allow 15 minutes after shutdown for DV/DT network to discharge.
  2 Voltage sharing resistors may need to be disconnected to obtain correct readings for tests between positions A, B & C...

# Appendix A – Modbus RTU Communication and MVC Plus Registers

The MVC Plus RS485 port allows users to connect the MVC Plus to a Modbus RTU network.

**Typical Modbus Network Connection** 

The MVC Plus supports the following Modbus functions:

Table A-1: Modbus Functions

| <b>Function Code</b> | MVC Description           | <b>Modbus Description</b> |
|----------------------|---------------------------|---------------------------|
| 3                    | Read Multiple Registers   | Read Holding Registers    |
| 4                    | (same as Function code 3) | Read Input Registers      |
| 5                    | Execution                 | Force Single Coil         |
| 6                    | Write Single Registers    | Preset Single Registers   |
| 9                    | Operation                 | -                         |
| 16                   | Write Multiple Registers  | Preset Multiple Registers |

#### **Modbus Message Frame (data format)**

#### **Function 3**

- a) Query: See Table A-2: Query of Function 3 Read Multiple Registers. In the MVC Plus the number of consecutive registers "Number of Registers" is limited to 125.
- b) Response: See Table A-3: Response to Function 3 Read Multiple Registers.

Table A-2: Query of Function 3 - Read Multiple Registers (Instance)

| Field Name (byte)               | Decimal | Hexadecimal |
|---------------------------------|---------|-------------|
| Slave Address                   | 247     | F7          |
| Function                        | 3       | 03          |
| Starting Data Address High Byte | 1001    | 03          |
| Starting Data Address Low Byte  | 1001    | E9          |
| Number of Registers High Byte   | 2       | 00          |
| Number of Registers Low Byte    | 2       | 02          |
| CRC Low Byte                    | 11521   | 01          |
| CRC High Byte                   | 11521   | 2D          |

Table A-3: Response of Function 3 - Read Multiple Registers (Instance)

| Field Name (byte)   | Decimal | Hexadecimal |
|---|---------|-------------|
| Slave Address   | 247     | F7          |
| Function  | 3       | 03          |
| Byte Count  | 4       | 04          |
| Data High Byte of 1 <sup>st</sup> Register from Starting Data Address |         | 00          |
| Data Low Byte of 1 <sup>st</sup> Register from Starting Data Address  | 10      | 0A          |
| Data High Byte of 2 <sup>nd</sup> Register from Starting Data Address | 100     | 00          |
| Data Low Byte of 2 <sup>nd</sup> Register from Starting Data Address  | 100     | 64          |
| CRC Low Byte  | 54605   | 4D          |
| CRC High Byte   | 54005   | D5          |

Note: The sum of Data High Bytes and Data Low Bytes equals the Byte Count.

Function 4: Same as Function 3

- a) Query: See Table A-4: Query of Function 5 Send Access Code (Instance).
- b) Response: See Table A-5: Response to Function 5 Send Access Code (Instance).

Table A-4: Query of Function 5 and Sub Function 1 – Send Access Code (Instance)

| Field Name (byte)      | Decimal | Hexadecimal |
|------------------------|---------|-------------|
| Slave Address          | 247     | F7          |
| Function               | 5       | 05          |
| Sub Function Low Byte  | 1       | 01          |
| Sub Function High Byte | I       | 00          |
| Data Low Byte          | 1       | 01          |
| Data High Byte         | 1       | 00          |
| CRC Low Byte           | 12505   | D9          |
| CRC High Byte          | 12505   | 30          |

Table A-5: Response of Function 5 and Sub Function 1 – Send Access Code (Instance)

| Field Name (byte)      | Decimal | Hexadecimal |
|------------------------|---------|-------------|
| Slave Address          | 247     | F7          |
| Function               | 5       | 05          |
| Sub Function Low Byte  | 1       | 01          |
| Sub Function High Byte | ı       | 00          |
| Data Low Byte          | 4       | 01          |

| CRC Low Byte           | 12505   | D9          |
| CRC High Byte          | 12505   | 30          |

Table A-6: Query of Function 5 and Sub Function 4 – Send Access Code (Instance)

| Field Name (byte)      | Decimal | Hexadecimal |
|------------------------|---------|-------------|
| Slave Address          | 247     | F7          |
| Function               | 5       | 05          |
| Sub Function Low Byte  | 4       | 04          |
| Sub Function High Byte | 4       | 00          |
| Data 1 Low Byte        | 25      | 19          |
| Data 1 High Byte       | 25      | 00          |
| Data 2 Low Byte        | 0       | 00          |
| Data 2 High Byte       | U       | 00          |
| CRC Low Byte           | 29021   | 5D          |
| CRC High Byte          | 29021   | 71          |

Table A-7: Response of Function 5 and Sub Function 4 – Send Access Code (Instance)

| Field Name (byte)      | Decimal | Hexadecimal |
|------------------------|---------|-------------|
| Slave Address          | 247     | F7          |
| Function               | 5       | 05          |
| Sub Function Low Byte  | 4       | 04          |
| Sub Function High Byte | 4       | 00          |
| Data 1 Low Byte        | 25      | 19          |
| Data 1 High Byte       | 23      | 00          |
| Data 2 Low Byte        | 0       | 00          |
| Data 2 High Byte       | U       | 00          |
| CRC Low Byte           | 29021   | 5D          |
| CRC High Byte          | 29021   | 71          |

- a) Query: See Table A-8: Query of Function 6 Write Single Registers.b) Response: See Table A-9: Response to Function 6 Write Single Registers

Table A-8: Query of Function 6 - Write Single Register (Instance)

| Field Name (byte)                                     | Decimal | Hexadecimal |
|---|---------|-------------|
| Slave Address   | 247     | F7          |
| Function  | 6       | 06          |
| Starting Data Address High Byte                       | 1001    | 03          |
| Starting Data Address Low Byte                        | 1001    | E9          |
| Data High Byte of Register from Starting Data Address | 50      | 00          |
| Data Low Byte of Register from Starting Data Address  | 50      | 32          |
| CRC Low Byte  | 52537   | 39          |
| CRC High Byte   | 52537   | CD          |

Table A-9: Response of Function 6 - Write Single Register (Instance)

| Field Name (byte)                                     | Decimal | Hexadecimal |
|---|---------|-------------|
| Slave Address   | 247     | F7          |
| Function  | 6       | 06          |
| Starting Data Address High Byte                       | 1001    | 03          |
| Starting Data Address Low Byte                        | 1001    | E9          |
| Data High Byte of Register from Starting Data Address | 50      | 00          |
| Data Low Byte of Register from Starting Data Address  | 30      | 32          |
| CRC Low Byte  | 39      |             |
| CRC High Byte   | 52537   | CD          |

Function 9 is used for special operations in MVC plus. Function code 9 uses sub-function code 48 to represent Remote Start/Stop function. The byte following the sub-function code is the Start and Stop Control Settings byte see table A-12.

- a) Query: See Table A-10. Query of Function 9 Reserved Operational Code.
- b) Response: See Table A-11. Response of Function 9 Reserved Operational Code.
- c) Start and Stop Control Settings: See Table A-12. Start and Stop Control Settings.

Table A-10: Query of Function 9 – Reserved Operational Code (Instance)

| Field Name (byte)                | Decimal | Hexadecimal |
|----------------------------------|---------|-------------|
| Slave Address                    | 247     | F7          |
| Function                         | 9       | 09          |
| Sub Function (Remote Start/Stop) | 48      | 30          |
| Start and Stop Control Settings  | 26      | 1A          |
| CRC Low Byte                     | 39287   | 77          |
| CRC High Byte                    | 39207   | 99          |

Table A-11: Response of Function 9 - Reserved Operational Code (Instance)

| Field Name (byte)                | Decimal | Hexadecimal |
|----------------------------------|---------|-------------|
| Slave Address                    | 247     | F7          |
| Function                         | 9       | 09          |
| Sub Function (Remote Start/Stop) | 48      | 30          |
| Start and Stop Control Settings  | 26      | 1A          |
| CRC Low Byte                     | 39287   | 77          |
| CRC High Byte                    | 39207   | 99          |

Table A-12: Start and Stop Control Settings

| Start and Stop Control Settings | Decimal | Hexadecimal |
|---------------------------------|---------|-------------|
| Start                           | 26      | 1A          |
| Stop                            | 27      | 1B          |

- c) Query: See Table A-13: Query of Function 16 Write Multiple Registers. In the MVC Plus the number of consecutive registers "Number of Registers" is limited to 125.
- d) Response: See Table A-14: Response to Function 16 Write Multiple Registers

Table A-13: Query of Function 16 - Write Multiple Registers (Instance)

| Field Name (byte)   | Decimal | Hexadecimal |
|---|---------|-------------|
| Slave Address   | 247     | F7          |
| Function  | 16      | 10          |
| Starting Data Address High Byte                                       | 1001    | 03          |
| Starting Data Address Low Byte  | 1001    | E9          |
| Number of Registers High Byte   | 2       | 00          |
| Number of Registers Low Byte  | 2       | 02          |
| Byte Count  | 4       | 04          |
| Data High Byte of 1 <sup>st</sup> Register from Starting Data Address | 15      | 00          |
| Data Low Byte of 1 <sup>st</sup> Register from Starting Data Address  | 15      | 0F          |
| Data High Byte of 2 <sup>nd</sup> Register from Starting Data Address | 101     | 00          |
| Data Low Byte of 2 <sup>nd</sup> Register from Starting Data Address  | 101     | 65          |
| CRC Low Byte  | 57029   | C4          |
| CRC High Byte   | 57028   | DE          |

**Note:** The sum of Data High Bytes and Data Low Bytes equals to the Byte Count, which equal to the Number of Registers times 2.

Table A-14: Response of Function 16 - Write Multiple Registers (Instance)

| Field Name (byte)               | Decimal | Hexadecimal |  |
|---------------------------------|---------|-------------|--|
| Slave Address                   | 247     | F7          |  |
| Function                        | 16      | 10          |  |
| Starting Data Address High Byte | 1001    | 03          |  |
| Starting Data Address Low Byte  | 1001    | E9          |  |
| Number of Registers High Byte   | 2       | 00          |  |
| Number of Registers Low Byte    | 2       | 02          |  |
| CRC Low Byte                    | 61060   | 84          |  |
| CRC High Byte                   | 61000   | EE          |  |

#### **Exception Response Frame**

In normal response, the function field will always return the function code as was used in the Query sent. If the slave device sends back an Exception response, 80 (hex) will be added to function code value to indicate an Exception response. See Table A-15: Invalid Query of Function 3 - Read Multiple Registers (Instance) and Table A-16 Response of the Invalid Function 3 Query. Also see Table A-16: Exception Codes

Table A-15: Invalid Query of Function 3 - Read Multiple Registers (Instance)

| Field Name (byte)               | Decimal  | Hexadecimal |
|---------------------------------|----------|-------------|
| Slave Address                   | 247      | F7          |
| Function                        | 3        | 03          |
| Starting Data Address High Byte | 999      | 03          |
| Starting Data Address Low Byte  | 999      | E8          |
| Number of Registers High Byte   | 1        | 00          |
| Number of Registers Low Byte    | <b>'</b> | 01          |
| CRC Low Byte                    | 61216    | 20          |
| CRC High Byte                   | 01210    | EF          |

Table A-16: Response of the Invalid Function 3 Query

| Field Name (byte) | Decimal | Hexadecimal |  |
|-------------------|---------|-------------|--|
| Slave Address     | 247     | F7          |  |
| Function          | 131     | 83          |  |
| Exception Code    | 2       | 02          |  |
| CRC Low Byte      | 15392   | 20          |  |
| CRC High Byte     | 15592   | 3C          |  |

Table A-17: Exception Codes

| Exception Code | Name                 | Description   |
|----------------|----------------------|---|
| 01             | Illegal Function     | Function code not supported.  |
| 02             | Illegal Address      | The register address is invalid.  |
| 03             | Illegal Data Value   | Invalid data received from the Rx.  |
| 06             | Device Busy          | The MVC Plus is busy. The master should retransmit the message again later. |
| 07             | Negative Acknowledge | The MVC Plus cannot perform function received from the query.               |
| 16             | Illegal Data Length  | The field "Number of Registers" from the query exceeds 125 registers.       |

#### **CRC Sequence**

CRC sequence each message frame is to send the Low Byte first and High Byte second, according to the MODBUS specification. However, to communication with the RS232 Front Port, the CRC sequence has to be reversed in all the query and response frames, High Byte first and Low Byte second.

Table A-18: MVC Plus Registers ordered by Modbus Address

|                 |              | INIODBOS REC                                      | SISTER MAP |                    |     |           |                                       |  |
|-----------------|--------------|---|------------|--------------------|-----|-----------|---------------------------------------|--|

| Metering Page 5 | 2900          | Event Count                                       | be used for  |  | n Event Recorde<br>he numbers of ev<br>Ill yet. |  | r. It also can   |  |
|                 | 2901          | Event Start                                       | UI- 0-63. A rolling pointer points to the oldest event - the starting event, while numbers of events are over 64 in ring buffer. It will not count unt ring buffer is full.  If (2900)<64, (2901) = 0;  If (2900)=64, (2901) >=0 and Newest event entry # = (2901) − 1. It is mod 64 subtraction.  For example, there are 64 events in event recorder, and the oldest event starts from event Entry #5 2980-2995. We then will have (2900)=64, Newest event entry # = (2901)-1 = 5-1= 4 and (2902)=64. And the newest event will be logged into Event Entry #4 2964-2979 because of the scrolling. Note that the newest event will override the "last" oldest event after the event recorder is full. The pointer 2901 will keep scrolling to tell us what the oldest event is - the starting event in this ring buffer. |  |   |  |  |  |
